2. Courses topics	5

1. Introduction

This report presents the outcomes of the course upgrading and team-teaching development carried out within WP3 of the NextGEng project. The implementation process led to the creation of **12 new English-language course modules**, developed across the three partner universities—TUCN, JAMK, and UJA (TUCN: 5 modules; JAMK: 3 modules; UJA: 4 modules). These modules were designed using student-centered and collaborative teaching approaches, integrating blended and digital delivery methods, eco-friendly concepts, and real-life case studies to ensure a modern and practice-oriented learning experience.

The development process was highly collaborative, involving **16 coordination meetings** across the co-teaching teams of courses C5–C6, with the participation of **12 higher-education teachers** and **5 industry experts**. This joint effort ensured alignment of content, consistent implementation across institutions, and the integration of industry-relevant competencies.

The pedagogical materials developed within this project are released under the Creative Commons CC BY-NC-SA license (Attribution – NonCommercial – ShareAlike). This license permits users to freely access, use, and adapt the materials provided that appropriate credit is given to the authors and the project. The materials may not be used for commercial purposes, and any adaptations or derivative works must be distributed under the same license terms.

In the next Chapters the produced courses modules are presented.

2. Courses topics

C5 - Computer Aided Design

Module 1 – Simulation of mechanical assemblies

Module 2 – FEA analysis of mechanical parts

Module 3 – Parametric Design with CATIA

Module 4 – 3D-Scanning

Module 5 - Reverse Engineering

Module 6 – Ecodesign

Module 7 - Re-design & Re-Using

C6 - Manufacturing Technology

Module 1 – 3D printing processes

Module 2 – Manufacturing technology of MEMS

Module 3 – Design for Additive Manufacturing (DfAM)

Module 4 – Additive Manufacturing Materials

Module 5 – Sustainable Additive Manufacturing

C5 – Computer Aided Design

M1 - Simulation of mechanical assemblies

CO - Technical University of Cluj-Napoca

Funded by the European Union. Views and opinions expressed are however those of the author(s) only and do not necessarily reflect those of the European Union or the European Education and Culture Executive Agency (EACEA). Neither the European Union nor EACEA can be held responsible for them.

Simulation of mechanical assemblies

Kinematic simulation of robotic systems

Dynamic simulations

Simulation of mechanical assemblies

Upon completion of this module, the student will be able to:

- 1) Create animations of assemblies defined in SolidWorks
- 2) Create simulations of assemblies defined in SolidWorks
- 3) Measure the kinematic and dynamic parameters of links during simulations

Content

- **Introduction**
- **Animations in SolidWorks**
- **Simulations in SolidWorks**
- **Results display and analysis**

Introduction

The Role of Simulation in Mechatronic Design

- Simulation of mechanical assemblies is essential in mechatronic design, where mechanical, electrical, and control systems must operate in synergy.
- Benefits:
 - Validate designs early, reducing the risk of errors before physical prototyping
 - Optimize performance, motion paths, and energy efficiency
 - Reduce development costs by identifying design flaws early in the process
 - Accelerate time-to-market by enabling faster design iterations
 - Improve sustainability by analyzing friction, material use, and energy consumption

Introduction

Types of animations/simulations in SolidWorks

Introduction

Motion Manager

- It is an interface (integrated into SolidWorks) that facilitates the creation of animations and/or motion analyses for assemblies created in SolidWorks.
- Types of analysis:
 - Animations
 - Basic Motions
 - Motion Analysis

Introduction

Motion Manager

- **Animation** – allows the creation of simple animations using interpolation to define the point-to-point movement of assembly components.
- **Basic Motion** – allows the approximation of the effects of motors, springs, contacts, and gravity on assemblies using physics-based simulations.
 - Takes component mass into account when generating motion
 - Fast computation
- **Motion Analysis** – enables accurate simulations and analysis of an assembly's motion by incorporating the effects of Motion Study elements (including forces, springs, dampers, and friction).
 - Types of analyses: time-based/event-based

Introduction

Designing of eco-friendly and sustainable systems

- **Energy Efficiency in Mechanical Design**
 - Simulation of energy consumption and losses in mechanical systems
 - Optimizing mechanical movements to reduce unnecessary energy waste
 - Using **Motion Analysis** to evaluate friction, damping, and efficiency
- **Environmental Impact of Motion and Kinematics**
 - Evaluating how different motion strategies affect energy consumption
 - Reducing unnecessary accelerations/decelerations in automated systems
 - Applying kinematic simulations to optimize robotic or automated processes for sustainability

Animations in SolidWorks

Co-funded by
the European Union

Co-funded by
the European Union

Animations

What is an animation?

■ Animations

- allows the creation of simple animations using interpolation to define the point-to-point movement of assembly components.
- Allows the creation of animations where motion is imposed through motors/mates.

■ When is animation used?

- Creating simple animations that define the movement of assembly components through points.
- Animation is used when physical phenomena such as mass, friction, torque, contact, and gravity are not required.

Animations

How SolidWorks calculate the animations?

- At time zero – an image is captured
- Advance the actuating elements by one frame
- Reconstruction
 - Constraint (mates) solving
 - In-context feature solving
- Capturing another frame
- Repeat

Animations

Animation – Motion Drivers

Animations

□ Keypoint Animations

Basic Workflow

- 
- Positioning the Timebar
 - Positioning components
 - Positioning the viewpoint
 - Adjusting Properties
 - Recording Keypoint (automatic or manual)
 - Repeat

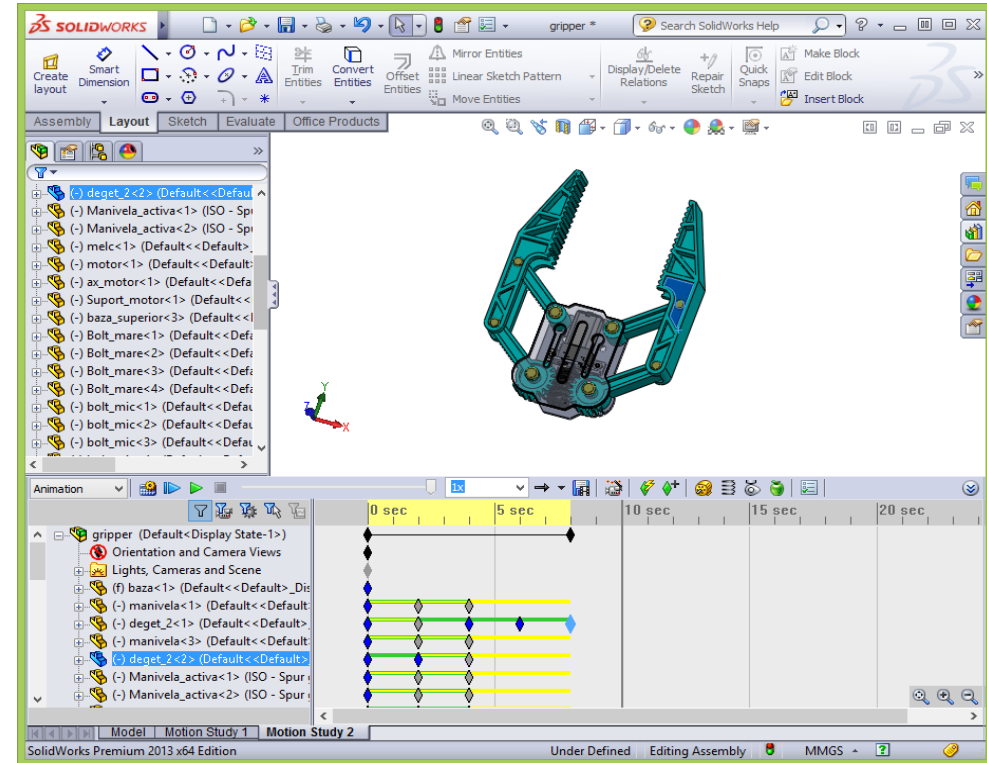

Autokey On

- Automatically positions key points at the current time bar position
- Calculates the animation so that the components reach the specified position
- Computes the movement of assembly components from the initial to the final position using interpolation functions

Autokey Off

- Key points must be set manually

Co-funded by
the European Union

Animations

Animations

Animation types:

- Rotate model
- Explode
- Collapse

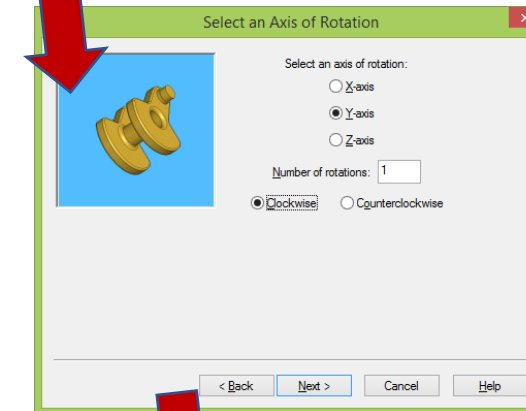

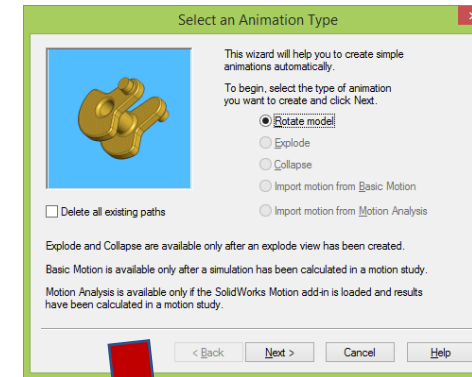

Import motion - after calculating motion using either Basic Motion or Motion Analysis, you can import the calculated motion results into an animation

Animations

Rotate model:

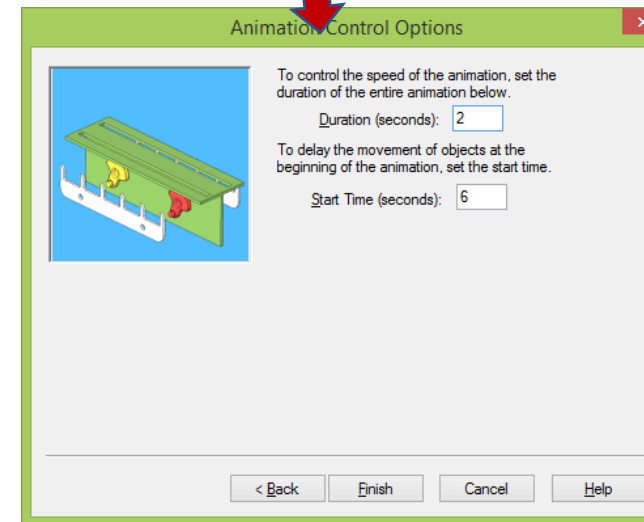

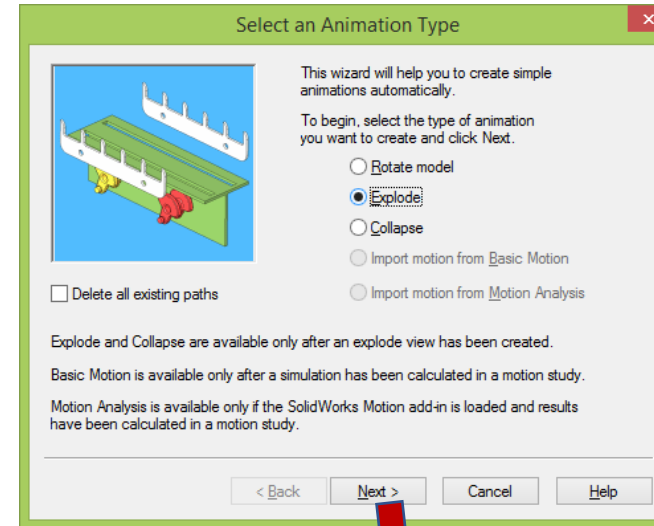

1. Click **Animation Wizard**
2. In the Select an Animation Type dialog box:
 - Select **Rotate model**.
 - Select **Delete all existing paths** if you want to remove any existing animation sequences
 - Click **Next**
3. In the **Select an Axis of Rotation** dialog box
 - Select X-axis, Y-axis, or Z-axis for **Select the axis of rotation**
 - Type a value for the **Number of rotations**
 - Select **Clockwise** or **Counterclockwise**
 - Click **Next**
4. In the **Animation Control Options** dialog box
 - Type a value for the **Duration** (seconds) of the animation
 - Type a value for the **Start Time** (seconds) of the motion
 - Click **Finish**

Animations

Explode/Collapse:

1. Click **Animation Wizard** 
2. In the Select an Animation Type dialog box:
 - Select **Explode** or **Collapse**
 - Select **Delete all existing paths** if you want to remove any existing animation sequences
 - Click **Next**
3. In the Animation Control Options dialog box
 - Type the **Duration (seconds)** of the animation in seconds
 - Type a value for the **Start Time (seconds)** of the motion
 - Click **Finish**

Animations

❏ Case study II

Gripper - Animation

- Rotate model
- Explode
- Collapse

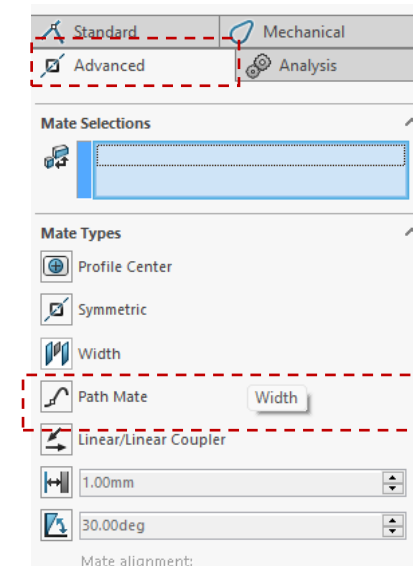

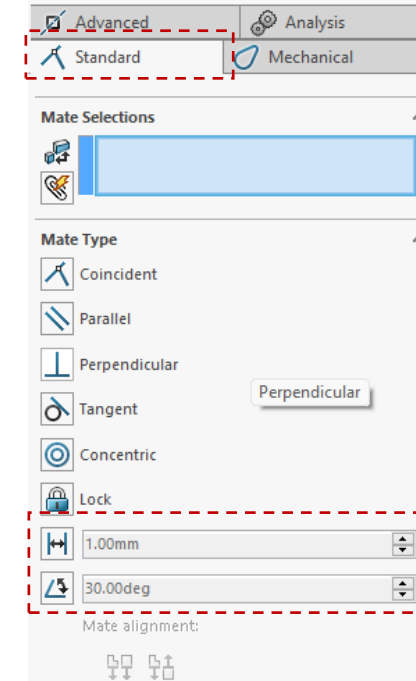

Animations

MOTION DRIVERS - MATES

- Mates that produce movement in animation
 - Distance Mate 
 - Angle Mate 
 - Path Mate 
- Driving Mates
 - Standard Mates (cu excepția celor prezentate mai sus)
 - Mechanical Mates

Note—Global Mates vs. Local

Animations

- Distance Mate
 - Values range from 0 to 100,000,000
 - Replace global mates with local mates dedicated to the animation
- Angle Mate
 - Values range from 0 to 360 [°].
- Path Mate
 - Free
 - Distance
 - Percent

Animations

- Distance Mate
 - ☒ Define the mate
 - ☐ Change the mate parameter to produce the animation

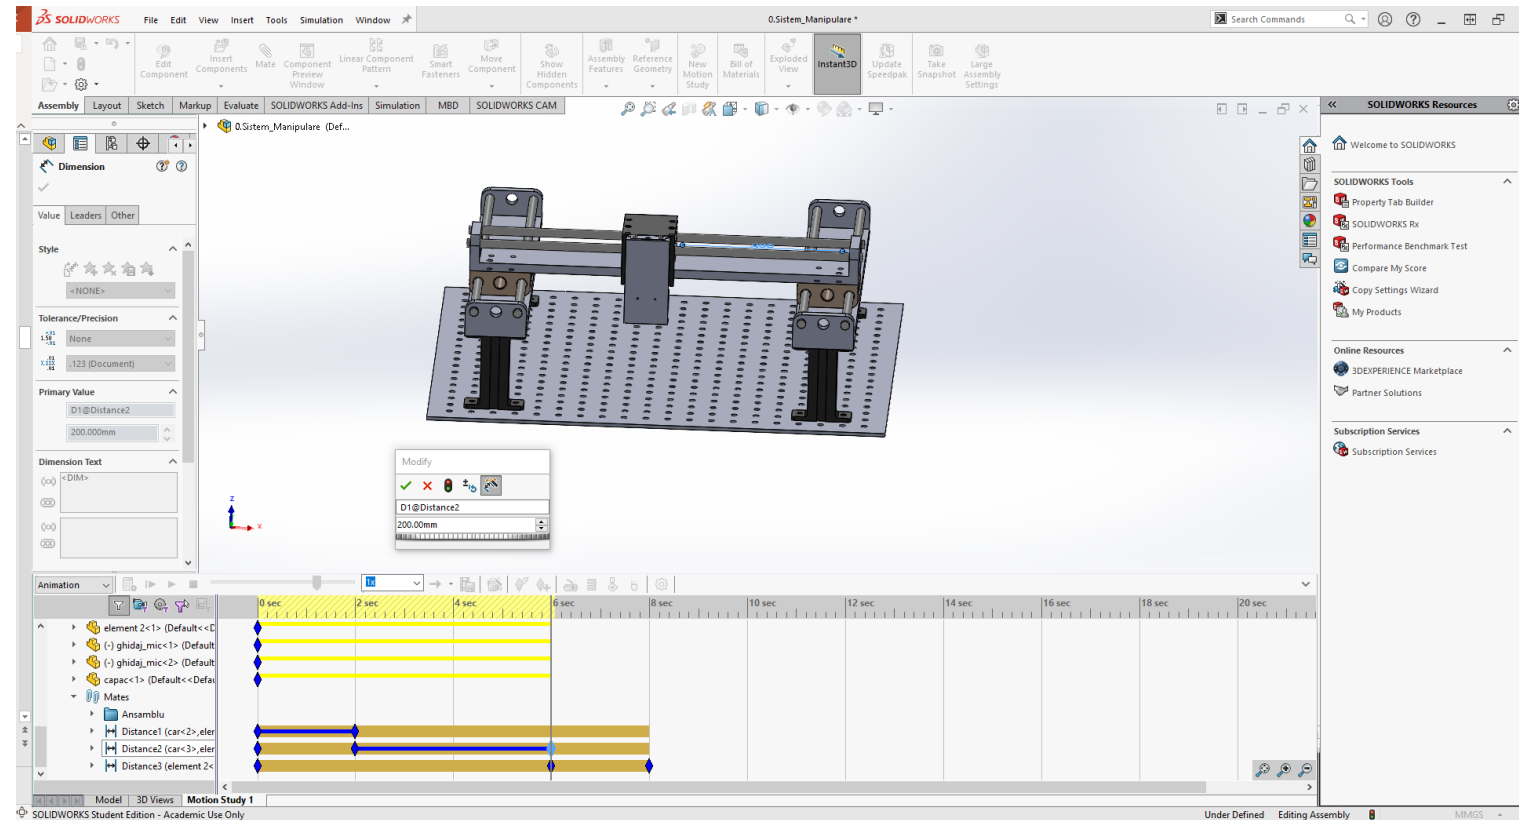

Co-funded by

Basic Motion

Motion Study Properties

- **Frames per second.** This value, multiplied by the length of the animation, specifies the total number of frames that are captured. This value does not affect the playback speed.
- **Geometry Accuracy.** Basic Motion makes meshes out of curved geometry. The higher the accuracy, the closer to actual geometry the mesh becomes. This makes collision simulation more accurate, but requires more time to compute.
- **3D Contact Resolution.** Controls the allowed amount of penetration within geometric meshes. Lower settings allow more penetration within the mesh. Using solid body **Contact** produces smoother motion, especially in tight-fit situations. For example, you can include solid body

Co-funded by
the European Union

Basic Motion

Basic Workflow

1. Select **Basic Motion** from the [Type of Study list](#) in the MotionManager
2. Select tools in the MotionManager toolbar to include simulation elements.
See [Linear or Rotary Motors](#), [Springs](#), [Solid body contact](#), and [Gravity](#).
3. Click **Calculate**  (MotionManager toolbar) to calculate the simulation.
4. Click **Play from Start**  (MotionManager toolbar) to play the simulation from the start.

Basic Motion

Basic Motion – Motion Drivers

	Key Points	Mates	Inertia	Gravity	Force	Spring	Motor	Contact	Friction	Damping	Event Based	Plots
Animation	X	X					X					
Basic Motion		X	X	X		X	X	X	L	L		
Motion Analysis		X	X	X	X	X	X	X	X	X	X	X

- X – Available Function
- L – Limit Functionality

Source: Dassault Systemes

Co-funded by
the European Union

Basic Motion

- **Gravity** is a simulation element that moves components around an assembly by inserting a simulated gravitational force

Gravity Parameters

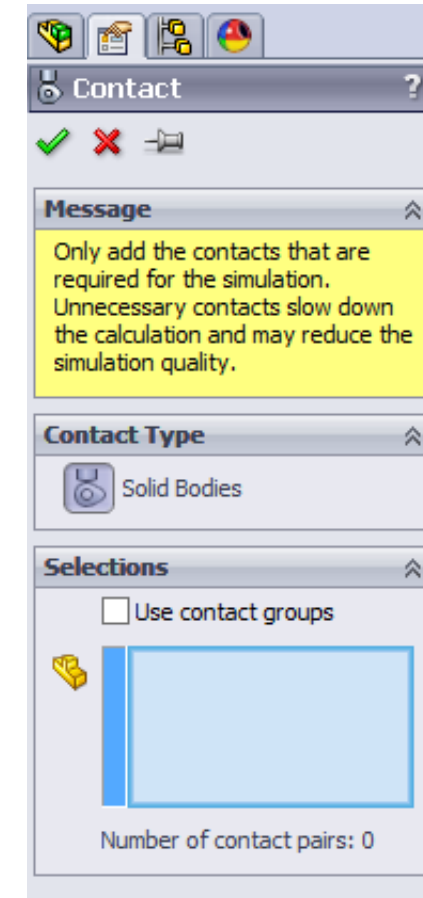

- **Direction Reference** Set a **Direction Reference** for gravity.
 - a face to orient gravity parallel to the normal
 - an edge to orient gravity parallel to the edge
 - X, Y, or Z to orient gravity in the chosen direction in the assembly reference frame
- **Numeric gravity value** - Set the **Numeric gravity value**. Default is standard gravity

Basic Motion

BASIC MOTION - CONTACT

- Helps to model component contact in a motion study when components ***collide***, ***roll***, or ***slide***
- can also use contact to constrain parts to touch throughout the motion analysis

Basic Motion

❑ Case study III

Contact - Animation

Basic Motion

BASIC MOTION - SPRING

Linear Spring - represents forces acting between two components over a distance and along a particular direction

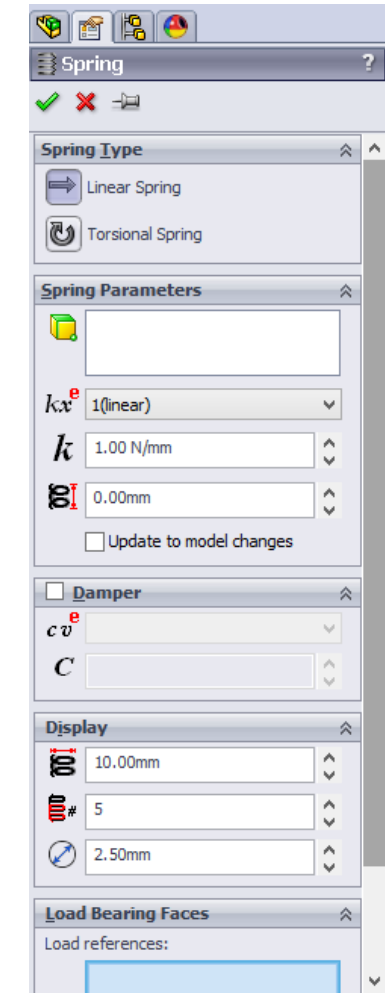

- Calculates the spring forces based on the distance between the locations of the two components
- Applies a force to the first part you select
- Applies an equal and opposite force along the line of sight of the second part you select

Torsional Spring - represents torsional forces acting between two components

- Calculates the spring moments, based on the angle between the two parts about the specified axis
- Applies a moment about the specified axis to the first part you select
- Applies an equal and opposite reaction moment to the second part you select

Note

- Can be used in Basic Motion and Motion Analysis

Co-funded by
the European Union

Basic Motion

BASIC MOTION - SPRING

Spring Constant

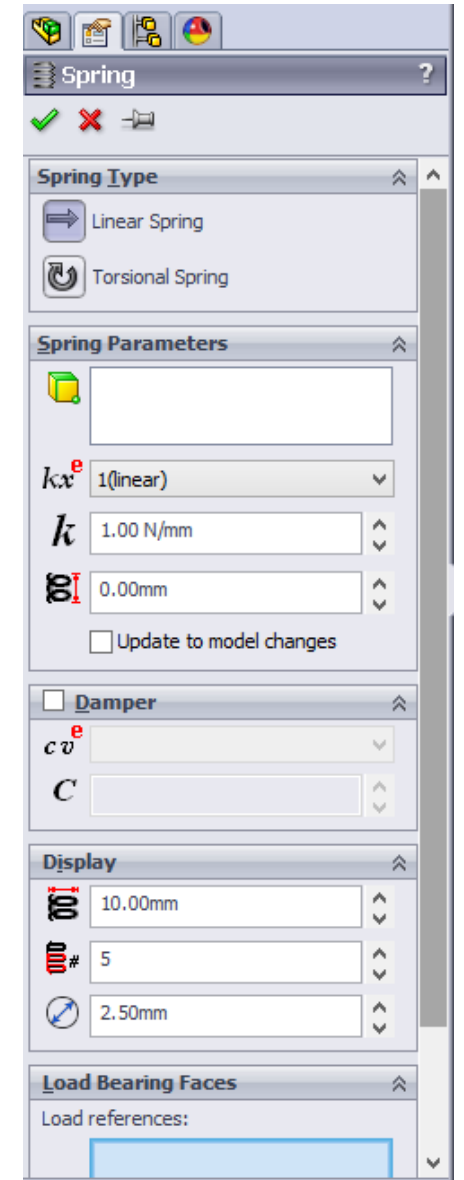

- $F = kx^e$
- Linear only in Basic Motion
- Powers of up to ± 4 in Motion Analysis
- Error in Basic Motion by one order of magnitude

Spring damping

- Global in Basic Motion
- Adjustable in Motion Analysis

Note

- Can be used in Basic Motion and Motion Analysis
- **Display** - you can view the display values only when the Spring PropertyManager is open, or when you calculate the study

Basic Motion

$$k=0.025 \text{ [N/mm]}$$
$$l=200 \text{ [mm]}$$

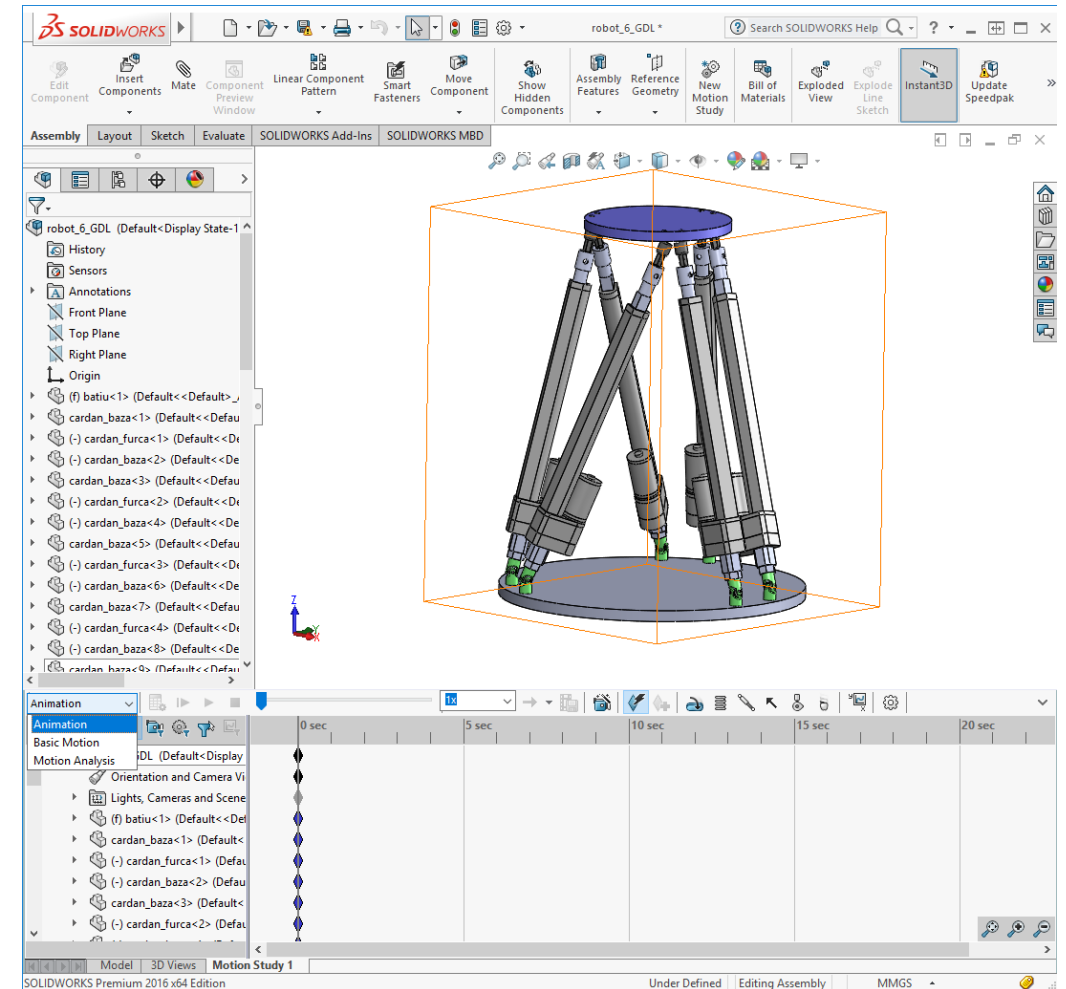

Co-funded by
the European Union

Motion Analysis

Motion Analysis – allows accurate simulation and analysis of the motion of an assembly by incorporating the effects of elements from the Motion Study (including forces, springs, dampers, and friction).

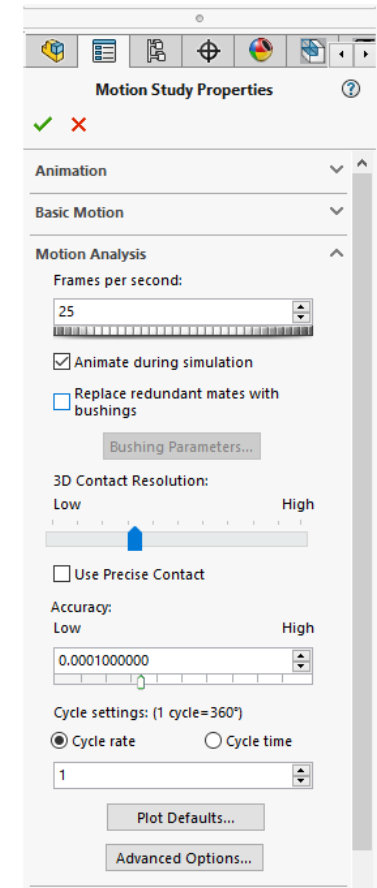

- Types of analyses
 - time-based
 - event-based.

Motion Analysis

Motion Study Properties

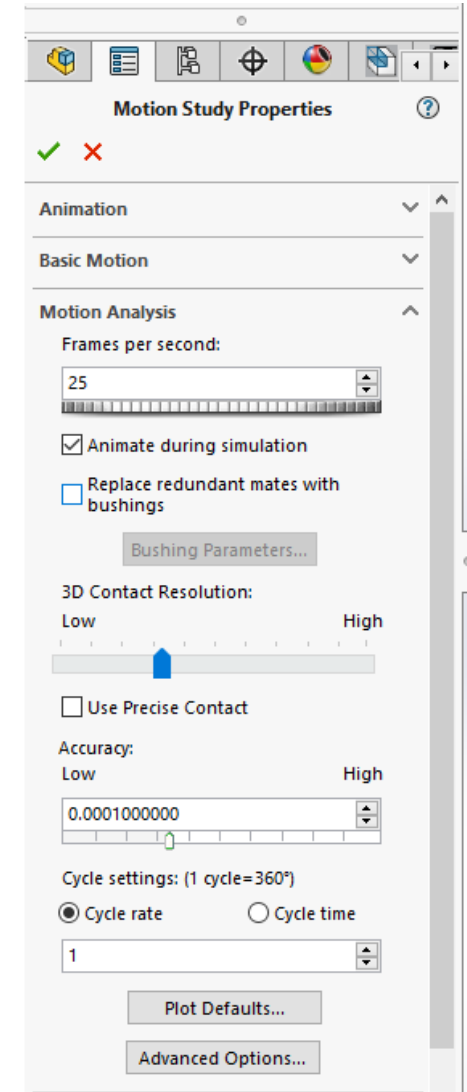

- **Frames per second.** Specifies the total number of frames that are captured when multiplied by the length of the animation. This value does not affect the playback speed.
- **Animate during simulation** - Clearing this option speeds up the calculation time and prevents the graphics from displaying the motion during calculation of the simulation.
- **3D Contact Resolution.** Increases the calculation time when you introduce solid body **Contact**
 - SOLIDWORKS Motion typically represents shapes as many-sided polygons. The higher the number of sides, the more closely SOLIDWORKS Motion approximates the actual geometry.

Motion Analysis

Motion Study Properties

- **Use Precise Contact.** Calculates contact by using the equations that represent the solid bodies. Clear to calculate contact approximately using the geometry of many-sided polygons. When you select **Use Precise Contact**, the computed contact is analytically correct, but the computation can take longer than an approximate solution.
- **Accuracy** - Increases the calculation time when higher values are selected.
- **Cycle setting.** Specifies the cycle rate or period. Cycle settings defines the cycle angle used in custom Motor or Force profiles.

Motion Analysis

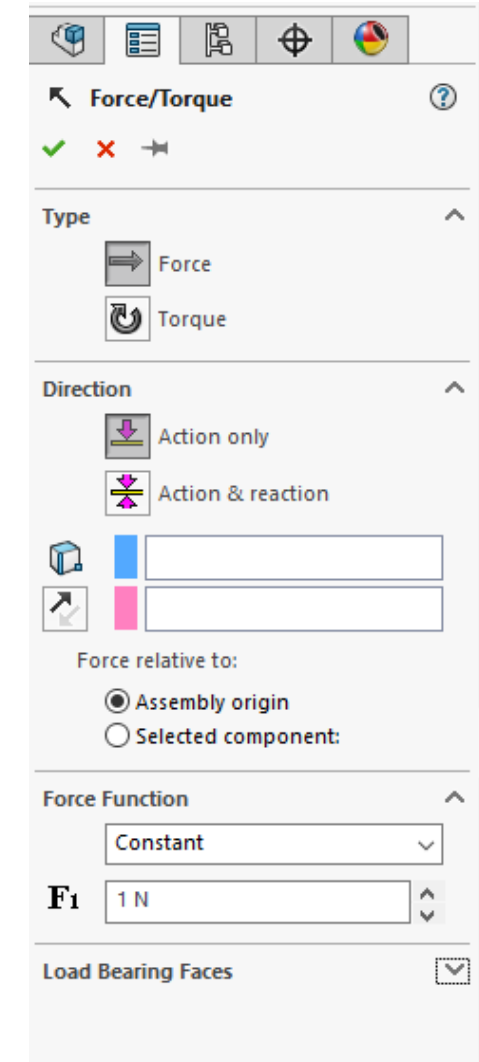

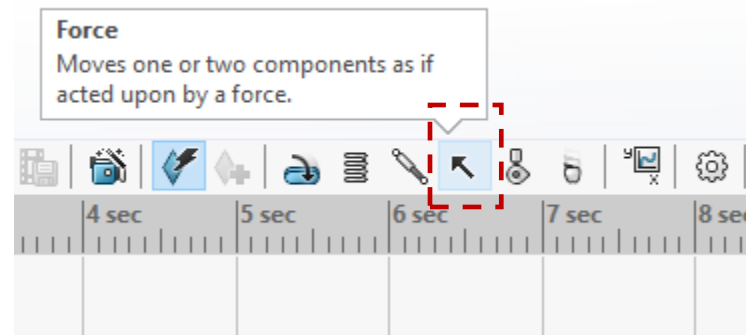

Force/Torque

 **Torsional Force** Specifies a torque.

 **Linear Force** Specifies a linear force.

 **Action only** Specifies the reference feature and direction for an action-only force or torque. An action-only force or torque acts on a body, but is not generated from a body.

 **Action & reaction** Specifies the reference feature and direction for an action-reaction force or torque. The action body generates the action force or torque, while the reaction body responds with an equal and opposite force or torque.

Introduction

What is a FEA simulation?

- **Finite Element Analysis (FEA)** is a [computational technique](#) used to obtain approximate solutions to complex engineering problems involving physical phenomena such as structural mechanics, heat transfer, fluid dynamics, and electromagnetism.

structural mechanics

[\[Source\]](#)

heat transfer

[\[Source\]](#)

fluid dynamics

the European Union

Introduction

How FEA simulation works?

- **Discretization:** The geometry is divided into a mesh of elements.
- **Element Equations:** Each element is governed by simplified physical equations.
- **Assembly:** The system of equations is assembled into a global system.
- **Boundary Conditions:** Loads, supports, and constraints are applied.
- **Solution:** The system is solved to obtain unknowns like displacement, stress, or temperature.
- **Postprocessing:** Results are visualized as plots or animations for interpretation

Co-funded by
the European Union

Introduction

Advantages of using FEA in the design process

- **Accurate prediction of performance and failure**
 - FEA enables engineers to simulate how a mechanical component or assembly behaves under operational conditions (e.g., static loads, dynamic loads, vibrations, temperature variations)
 - It helps identify **stress concentrations**, **critical failure points**, and **fatigue-prone areas** before physical testing
 - Enables **virtual validation** of designs according to real-world standards (e.g., ISO)
- Reduces the need for physical prototypes
- Supports design optimization
- Saves time and cost during product development

Introduction

Advantages of using FEA in the design process

- Accurate prediction of performance and failure
- **Reduces the need for physical prototypes**
 - Early design validation with FEA reduces the number of **iterations in physical prototyping**
 - Engineers can test multiple scenarios and **what-if conditions** virtually, which lowers costs and accelerates the R&D process
 - Minimizes **material waste** and production setup costs for prototype fabrication (**eco-friendly**)
- Supports design optimization
- Saves time and cost during product development

Introduction

Advantages of using FEA in the design process

- Accurate prediction of performance and failure
- Reduces the need for physical prototypes
- **Supports design optimization**
 - FEA allows for parametric and topology optimization of components to **maximize strength-to-weight ratios, improve stiffness, or minimize deformation**
 - Support **designing lighter, more efficient** components—crucial in sectors like automotive, aerospace, and robotics
 - Enables **multi-physics optimization** by considering thermal, structural, and fluid interactions together
- Saves time and cost during product development

Introduction

Advantages of using FEA in the design process

- Accurate prediction of performance and failure
- Reduces the need for physical prototypes
- Supports design optimization
- **Saves time and cost during product development**
 - Integrating FEA into early design stages shortens the overall **product development lifecycle**
 - Detecting flaws early prevents **costly redesigns** later in manufacturing
 - Reduces dependence on **trial-and-error engineering** approaches and speeds up the **time-to-market**

Introduction

Designing of eco-friendly and sustainable systems

▪ Reduced Material Waste

- FEA allows precise stress and strain analysis, enabling material minimization without compromising safety
- Supports lightweight design, especially in automotive and aerospace applications, reducing material usage and carbon footprint

▪ Improved Energy Efficiency

- Enables optimization of thermal management and mechanical efficiency in components

▪ Supports Sustainable Innovation

- Empowers engineers to experiment with eco-friendly materials and biomimetic designs in a low-risk digital environment

FEA simulation

SimulationXpress is a built-in tool available in all versions of SolidWorks, designed for quick and basic linear static analysis on individual parts.

SolidWorks Simulation is a comprehensive FEA suite that supports advanced analysis of both parts and assemblies.

Feature / Criteria	SimulationXpress	SolidWorks Simulation
Included in	All SolidWorks versions (part-only analysis)	Add-in module (Standard, Professional, Premium tiers)
Type of Analysis	Linear static analysis on individual parts	Linear, nonlinear, dynamic, thermal, frequency, fatigue, etc.
Assemblies Support	Not supported	Full support for assemblies
Material Models	Basic (linear, isotropic materials only)	Advanced (nonlinear, orthotropic, plasticity, etc.)
Loading Conditions	Limited to simple forces and fixtures	Full range: forces, torques, pressures, gravity, thermal loads
Meshing Options	Automatic, basic mesh only	Advanced mesh control (manual, curvature-based, refinement)
Contact Simulation	Not available	Supports bonded, no penetration, frictional contacts
Reporting and Postprocessing	Basic result plot (stress, displacement)	Full control: animations, stress plots, safety factor maps

FEA analysis using SimulationXpress

Steps in Performing an Analysis

❑ Step 1 – Accessing the *SimulationXpress* Module

- Open the **part** to be analyzed in SolidWorks.
- Go to the **Evaluate** tab and select **SimulationXpress Analysis Wizard**.

SimulationXpress Module

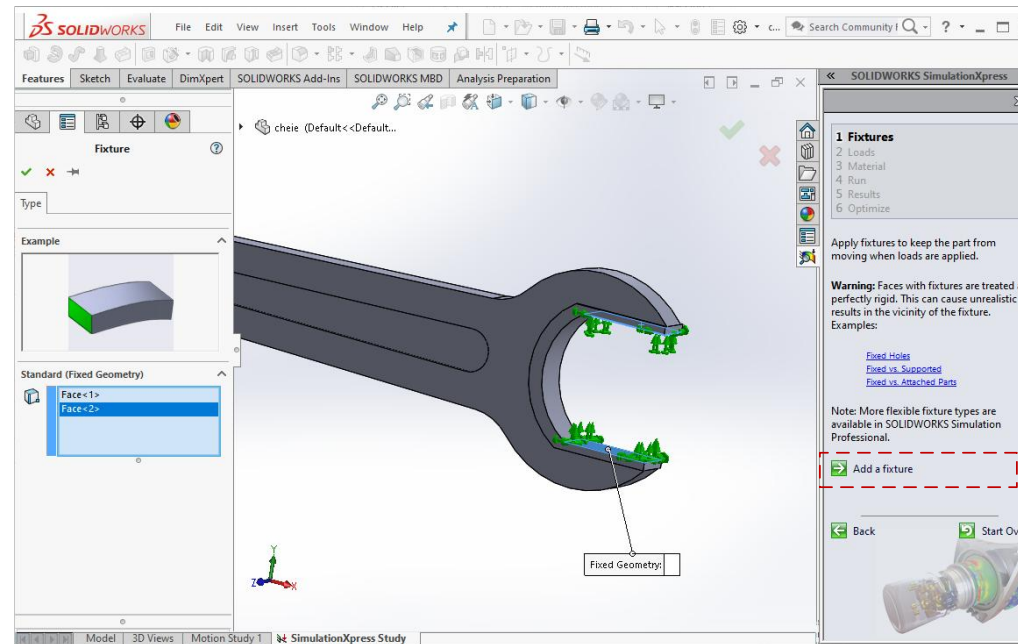

Note - Alternatively, it can be accessed via *Tools > Xpress Products > SimulationXpress*

FEA analysis using SimulationXpress

Steps in Performing an Analysis

❑ Step 2 - Define Fixtures (Motion Constraints)

- In the **Fixtures** step of the wizard, click **Add Fixture**.
- Select the face(s) of the part considered fixed (immobile).

FEA analysis using SimulationXpress

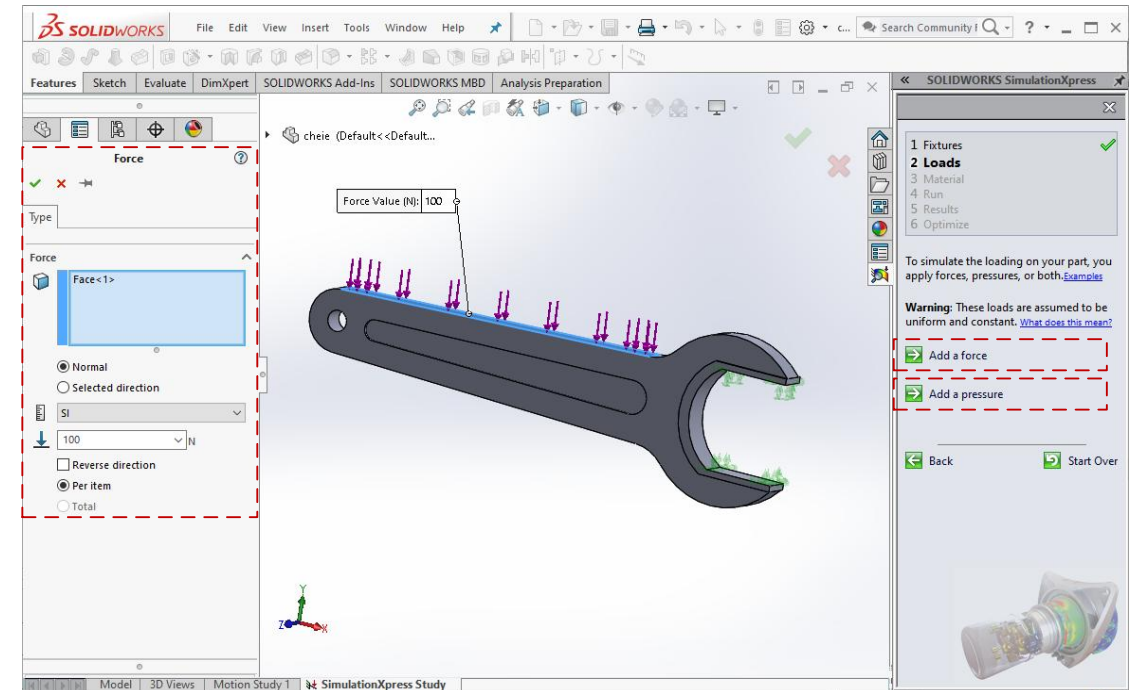

Steps in Performing an Analysis

❏ Step 3 – Define External Loads

- Based on the type of loads acting on the part, choose:
 - ➔ Add a Force
 - ➔ Add a Pressure
- Select the regions where the load applies and set its magnitude and direction.

Note - Default load direction is **normal to the surface**.

- For forces: use **Selected Direction** to modify the force direction.
- For pressure: use **Use Reference Geometry** to define the direction relative to planes

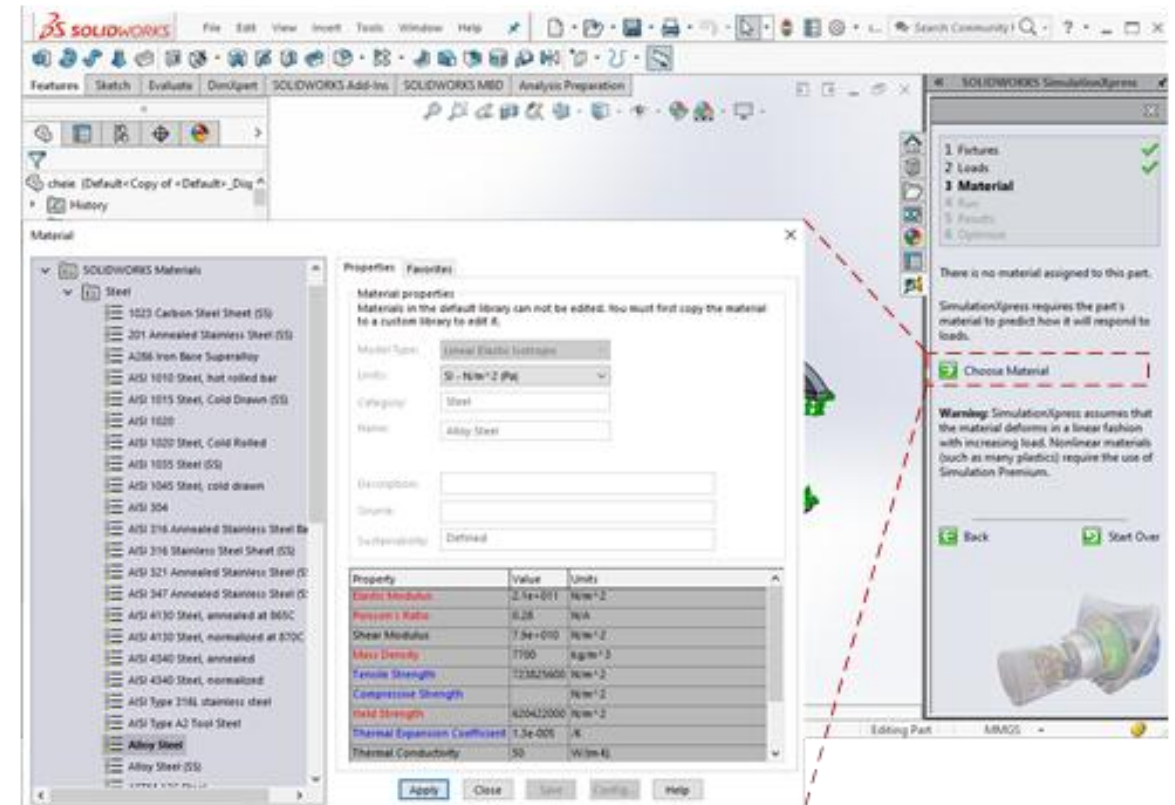

FEA analysis using SimulationXpress

Steps in Performing an Analysis

❑ Step 4 – Assign Material to the Part

- Use **Choose Material** option to assign the material to the analyzed part
- The user can choose from already existing materials from the library or create a custom one

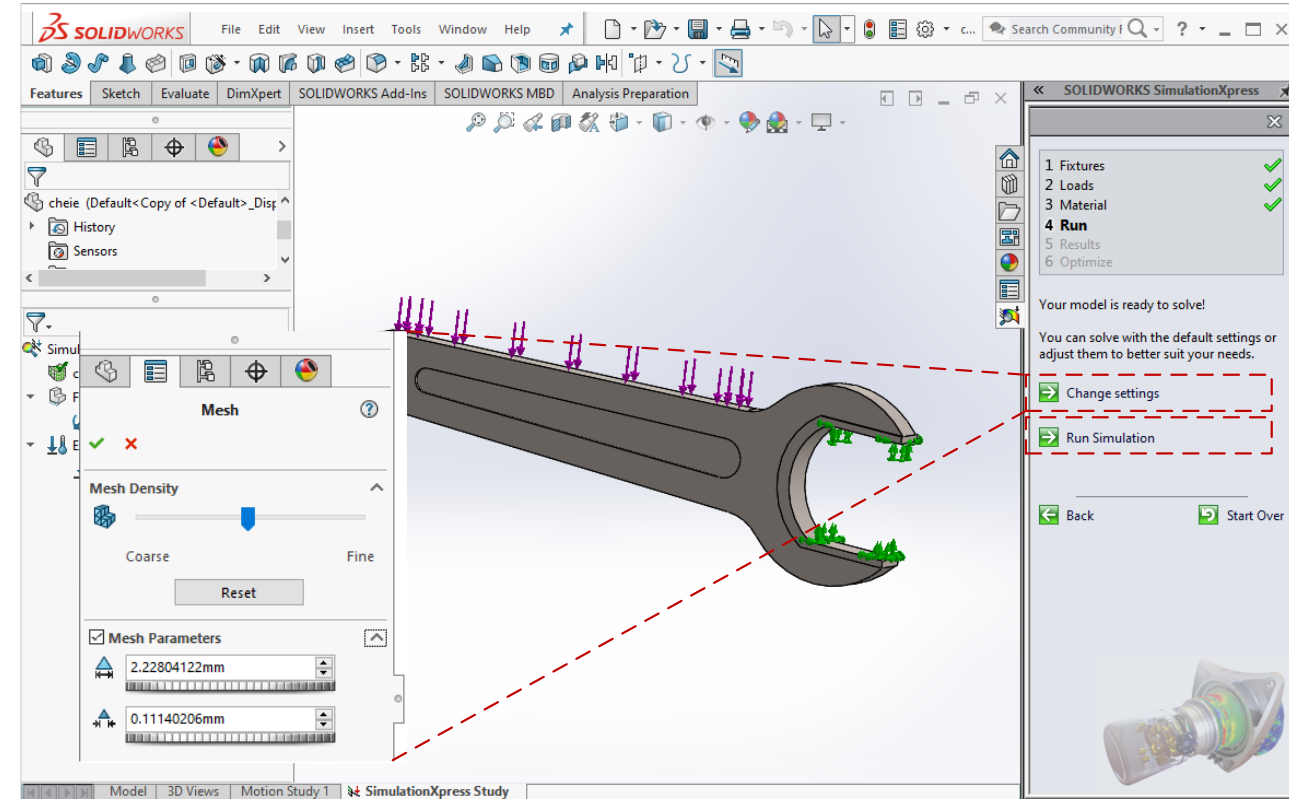

FEA analysis using SimulationXpress

Steps in Performing an Analysis

Step 5 – Configure and Run the Simulation

- Use **Change Settings** to adjust the mesh (finite element grid).
 - a finer mesh increases accuracy but also increases computation time.
- Click **Run Simulation** to start the analysis
 - SolidWorks creates nodes on surfaces and within the volume using tetrahedral elements

FEA analysis using SimulationXpress

Steps in Performing an Analysis

❑ Step 6 – View Results

➡ Show von Mises Stress

- Displays equivalent von Mises stress due to applied loads.
- Stress is visualized using a **color scale** (blue = low, red = high).
- **Von Mises stress** is a scalar measure derived from the stress tensor, used to compare a three-dimensional stress state to an equivalent uniaxial stress, in order to predict material yielding

$$\sigma_v = \sqrt{\frac{1}{2} [(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2]}$$

Note - Deformations are exaggerated in display for visibility (amplification factor shown on screen).

FEA analysis using SimulationXpress

Steps in Performing an Analysis

❏ Step 6 – View Results

➡ *Show Displacement*

- visualizes the part's displacement due to applied
- uses a **color gradient** (blue = minimal, red = maximal displacement)

Note - Deformations are exaggerated in display for visibility (amplification factor shown on screen).

FEA analysis using SimulationXpress

Steps in Performing an Analysis

❑ Step 6 – View Results

➡ *Show where factor of safety (FOS) is below*

- Highlights areas where the FOS is below a user-defined threshold.
- Blue = safe zone, Red = risk zone (FOS below limit).

FEA analysis using SimulationXpress

Example

- Task: Determine the displacement and the safety factor of a chair frame for a given imposed weight.

Input data:

- Load : A person weighing 122 Kg
- Material : steel alloy

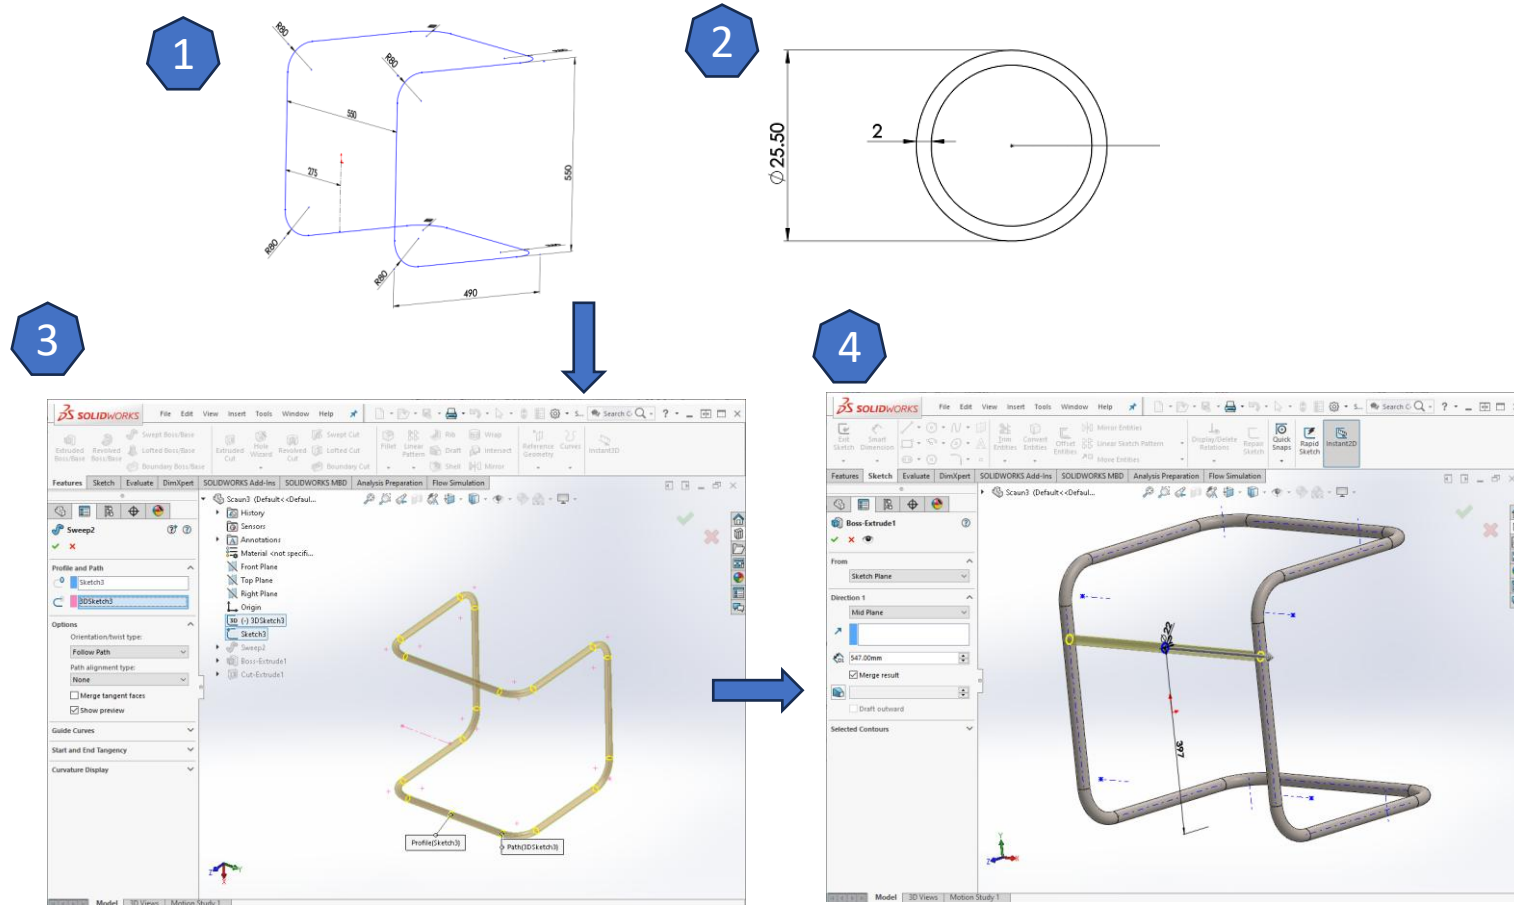

Co-funded by
the European Union

FEA analysis using SimulationXpress

Example

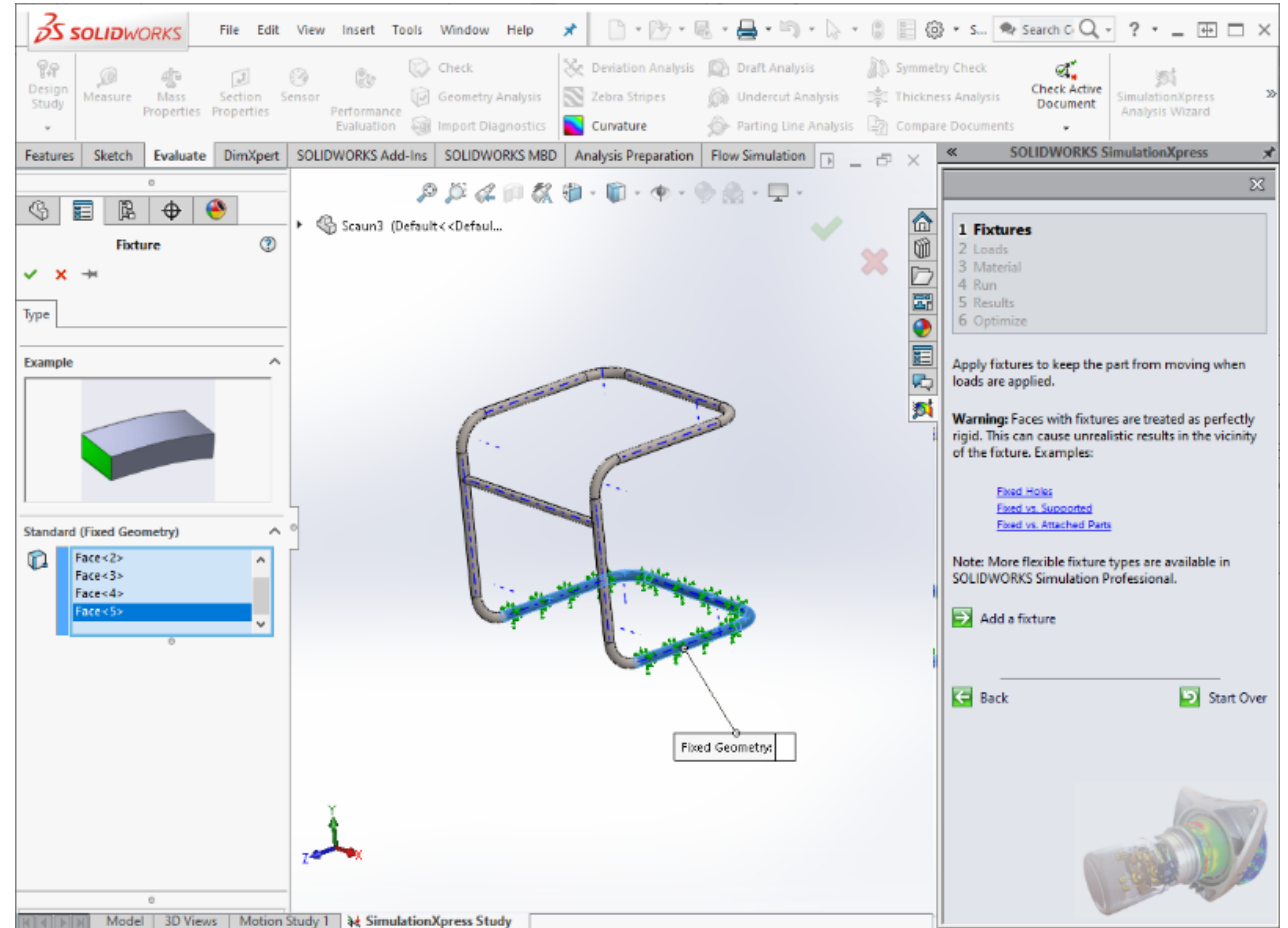

- Development of the chair frame
 - Create a **3D sketch** that define the shape of the chair frame (1)
 - Create a **cross section** of the pipe that forms the frame (2)
 - Use **Sweep** command to create the frame (3)
 - Create the transverse bar that supports the seat of the chair (4)

FEA analysis using SimulationXpress

Example

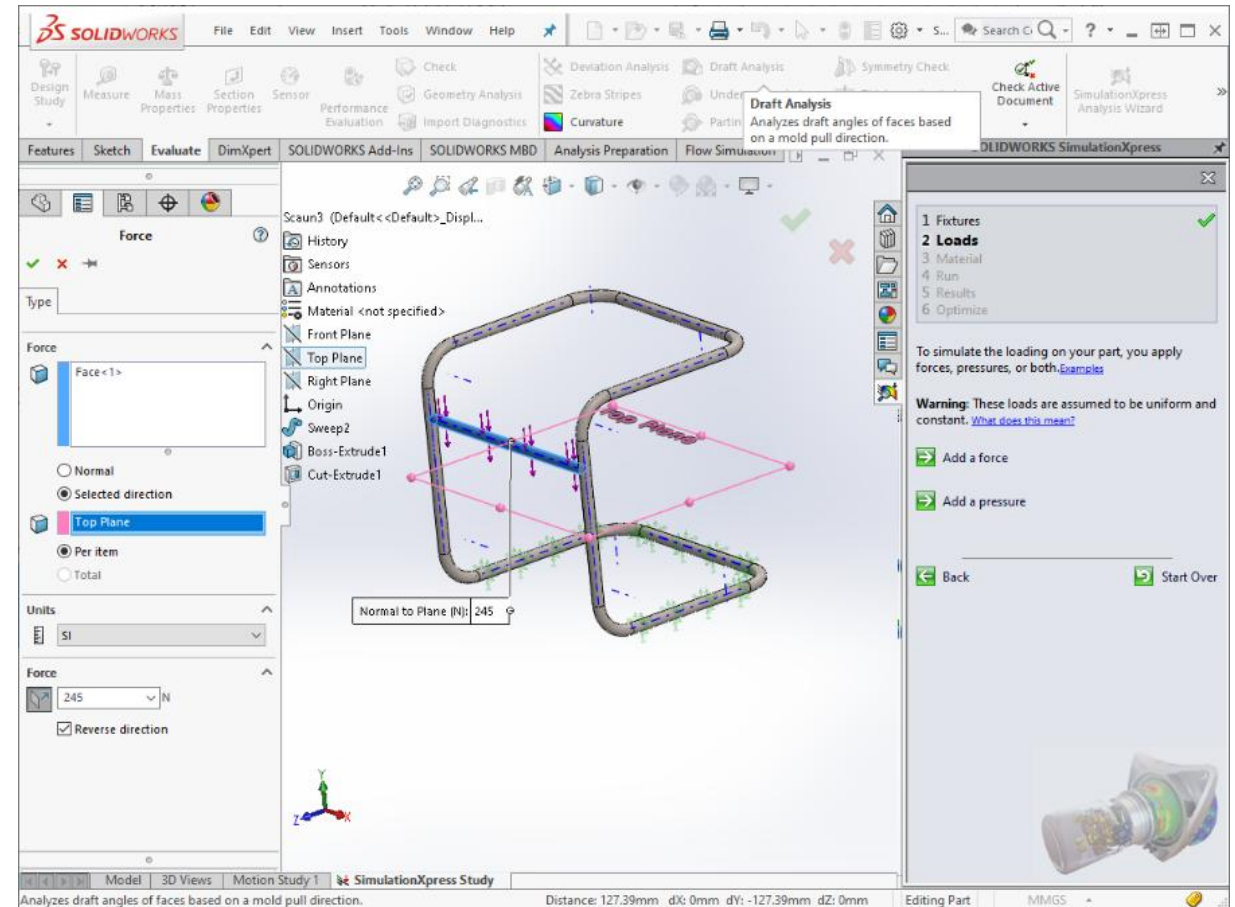

- Defining the fixtures
 - Click **Add a fixture**
 - Select all the surfaces that are in contact with the ground
 - Click the **Ok** button

FEA analysis using SimulationXpress

Example

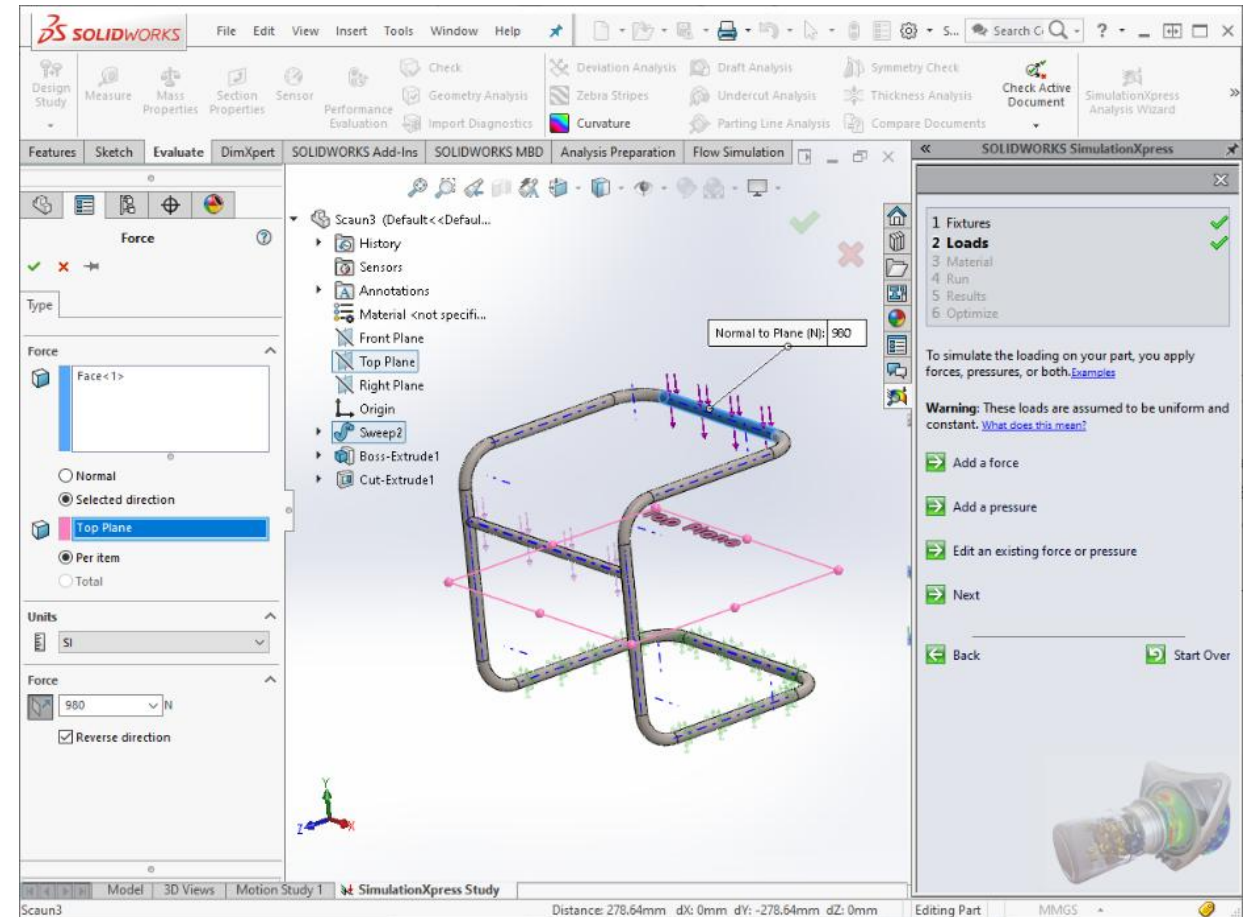

- Defining the forces that act on the chair
 - Click **Add a force**
 - Add **Force 1** (20% of the person weight)
 - Select the front horizontal bar
 - Introduce a force value of 245 N
 - Click **Select direction** option and choose *Top Plane*
 - Click **Ok** button

FEA analysis using SimulationXpress

Example

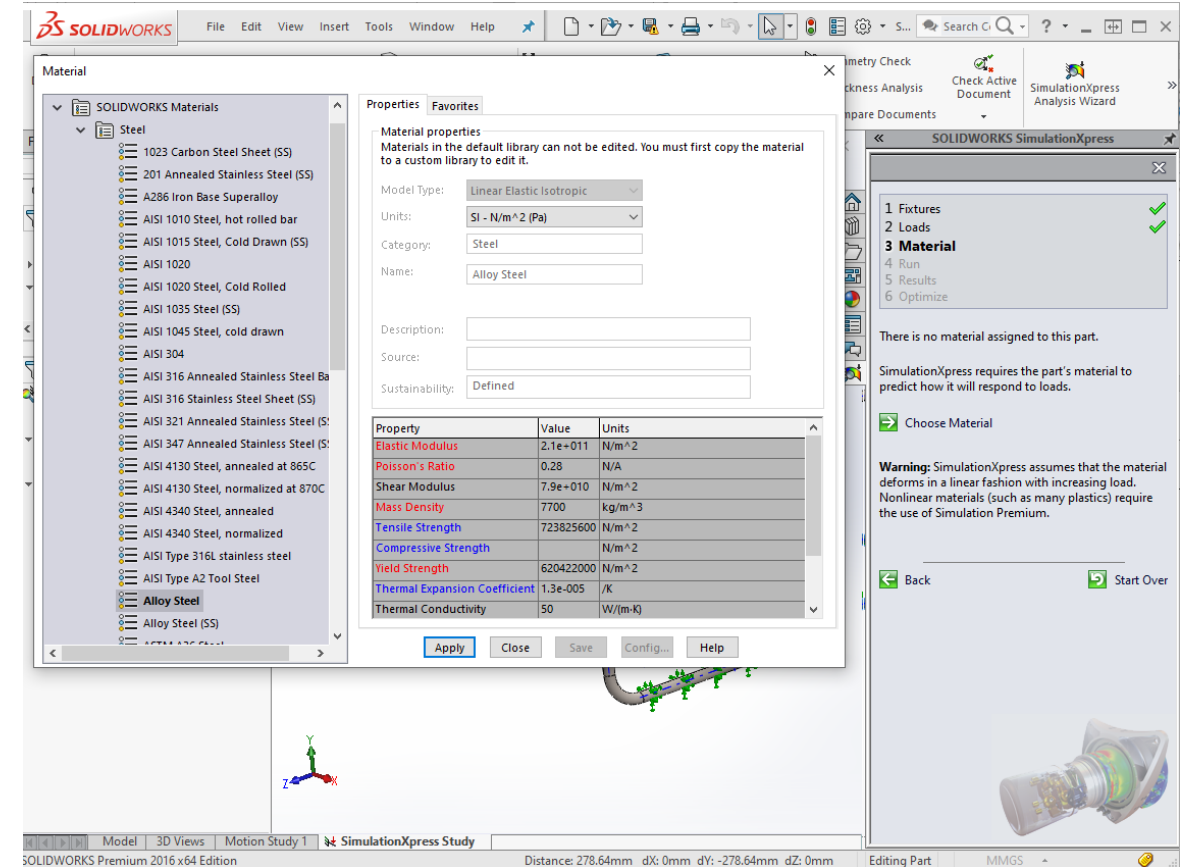

- Defining the forces that act on the chair
 - Click **Add a force**
 - Add **Force 2** (80% of the person weight)
 - Select the front horizontal bar
 - Introduce a force value of 980 N
 - Click **Select direction** option and select *Top Plane*
 - Click **Ok** button

FEA analysis using SimulationXpress

Example

- Defining the frame material
 - Click **Choose material**
 - From the list of predefined materials, select *Alloy Steel*
 - Click **Apply** button

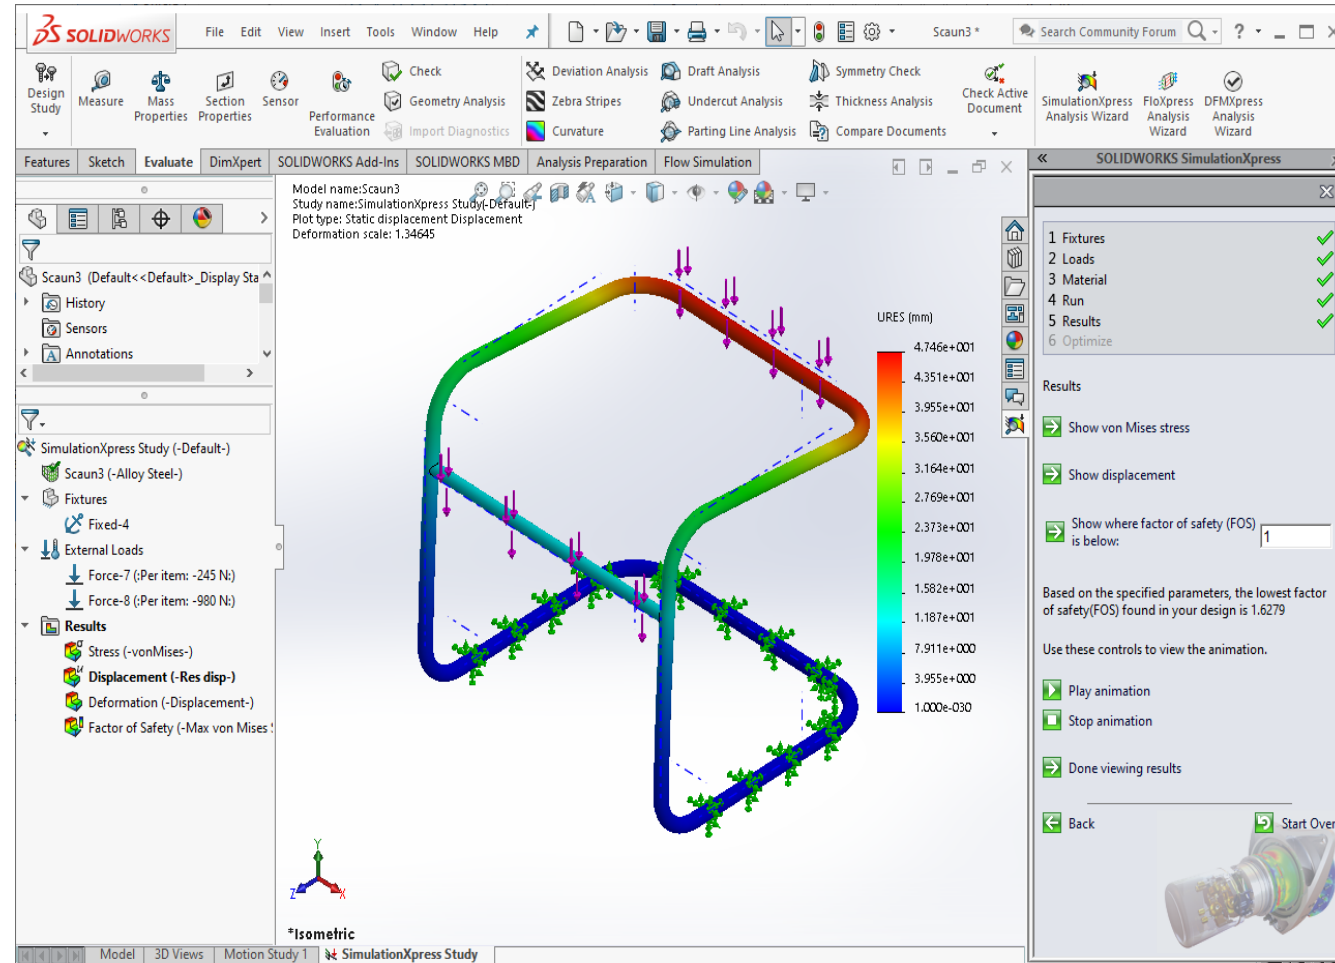

FEA analysis using SimulationXpress

Example

Simulation results

- Displacement (max):
 - 47.4 [mm]
- Factor of safety
 - 1.627

Part dimensional optimization using FEA

Co-funded by
the European Union

Co-funded by
the European Union

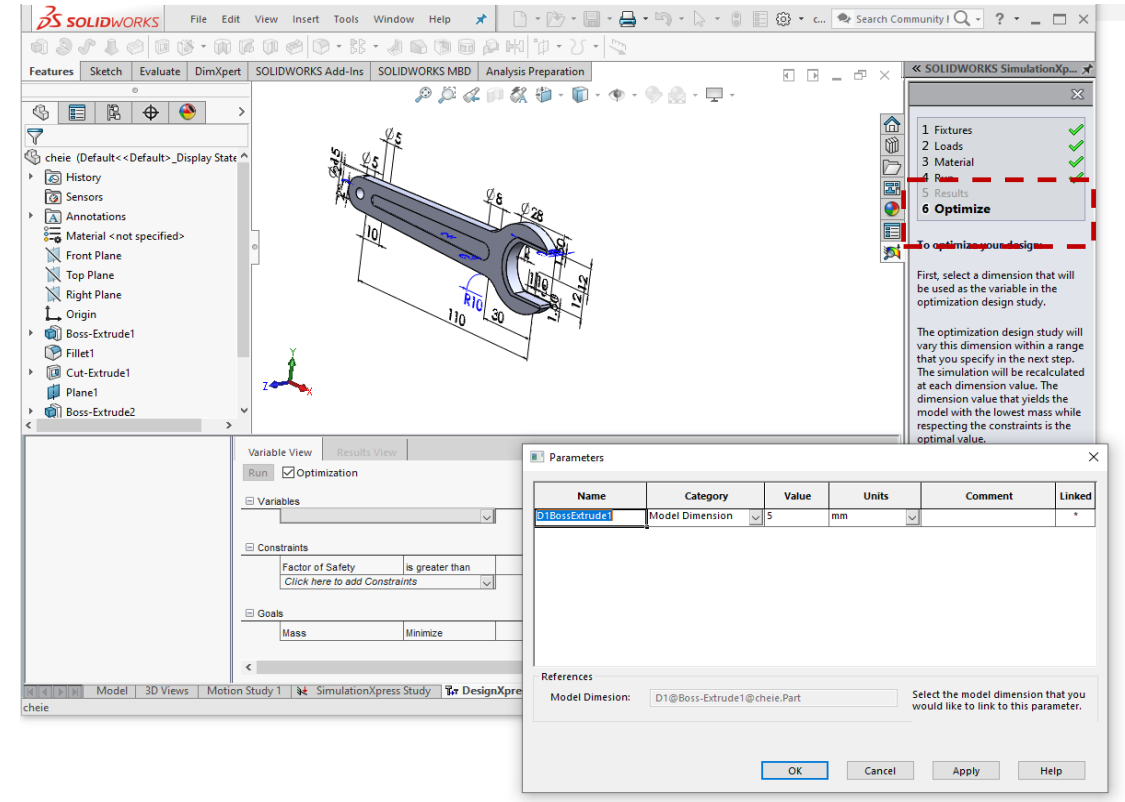

Part dimensional optimization using FEA

- **Optimization criteria:**

- von Mises stresses
- displacements
- safety factor

- From the **SimulationXpress Analysis Wizard** dialog window, select the option "**Would you like to optimize your model?**"

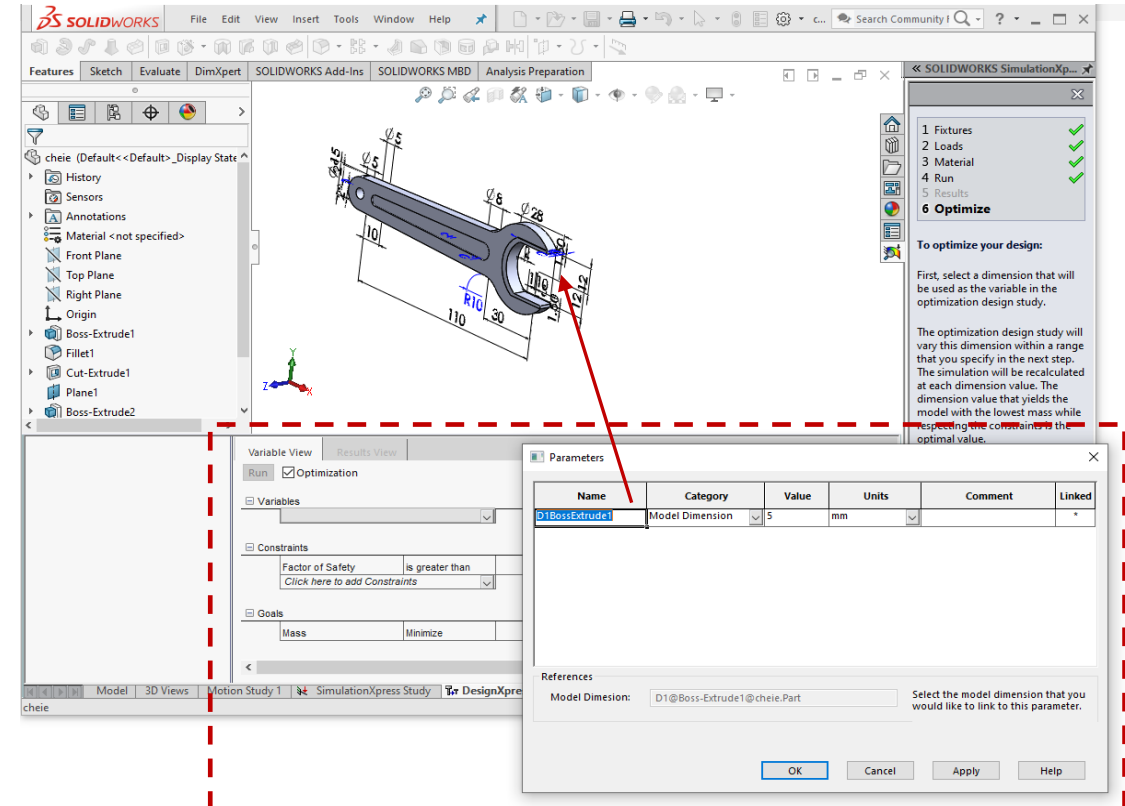

Part dimensional optimization using FEA

Steps in Performing the dimensional optimization

❑ Step 1 – Selection of the parameter for optimization

- Click **Variables** section in Variable view area
- In the **Parameters** dialog window select a dimension from the graphics area (part dimensions) or from the FeatureManager design tree

Note -The selected dimension will be varied during the optimization process to meet the chosen goal and constraints.

Part dimensional optimization using FEA

Steps in Performing the dimensional optimization

❑ Step 2 – Define the constraint to be evaluated

- From the DesignXpress study dialog window, in the Constraints option, select the constraint for which the optimization will be performed:
 - Factor of Safety
 - Max Displacement
 - Max Stress

Note - For the **Factor of Safety** option, the minimum accepted value must be entered.

Note - In the case of the **Max Displacement** or **Max Stress** options, the maximum accepted value must be entered.

Part dimensional optimization using FEA

Steps in Performing the dimensional optimization

❑ Step 3 – Run the optimization

- After configuring the optimization parameters, to run the optimization process, select the option from the SimulationXpress Analysis Wizard window:

 *Run the optimization*

Part dimensional optimization using FEA

Steps in Performing the dimensional optimization

❑ Step 4 – Evaluate the results

- In the **Results View** tab, the initial values and the values obtained after optimization are displayed in tabular form.

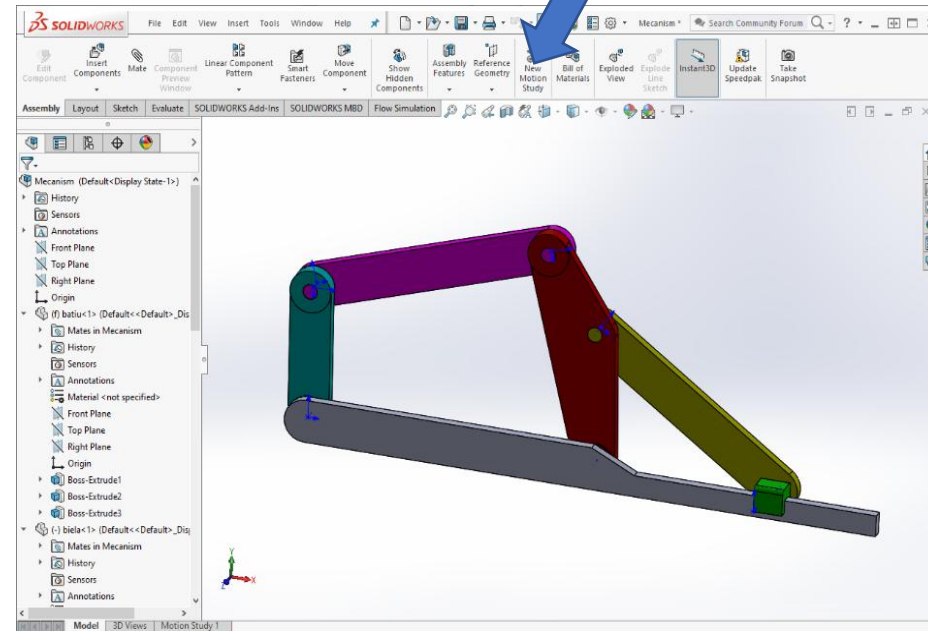

Variable View	Results View	
	Initial	Optimal
D1BossExtrude1 (0.00277133)	5mm	2.77133mm
Factor of Safety	32.817032	20.298346
Mass	0.0850677 kg	0.0460483 kg

Part dimensional optimization using FEA

Example

Tasks:

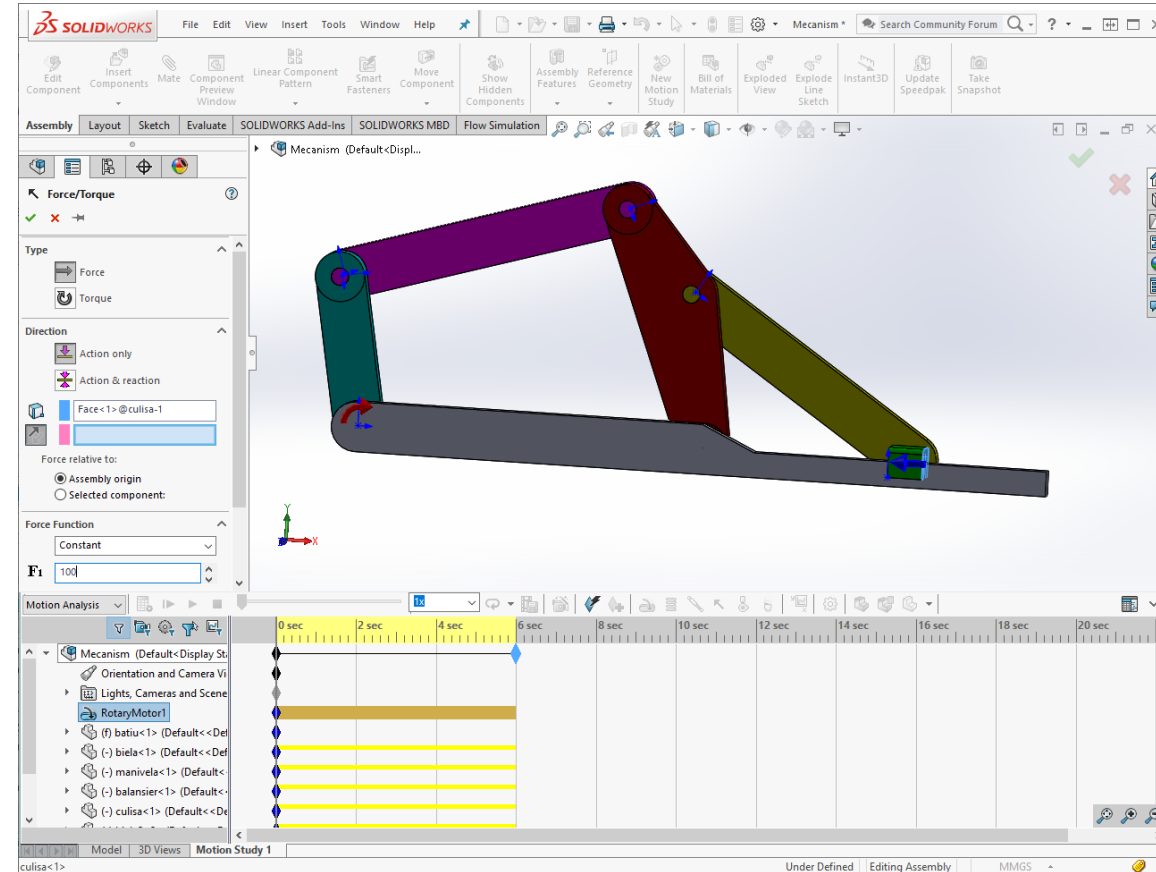

- Determine the reaction force in the kinematic joint A and the driving torque required for a complete operating cycle.
- Determine the deformation and the safety factor for the driving kinematic element (1) (based on the reaction force at pair A).
- Optimize the thickness of the kinematic element 1 so that the minimum safety factor is higher than 2

Part dimensional optimization using FEA

□ Example

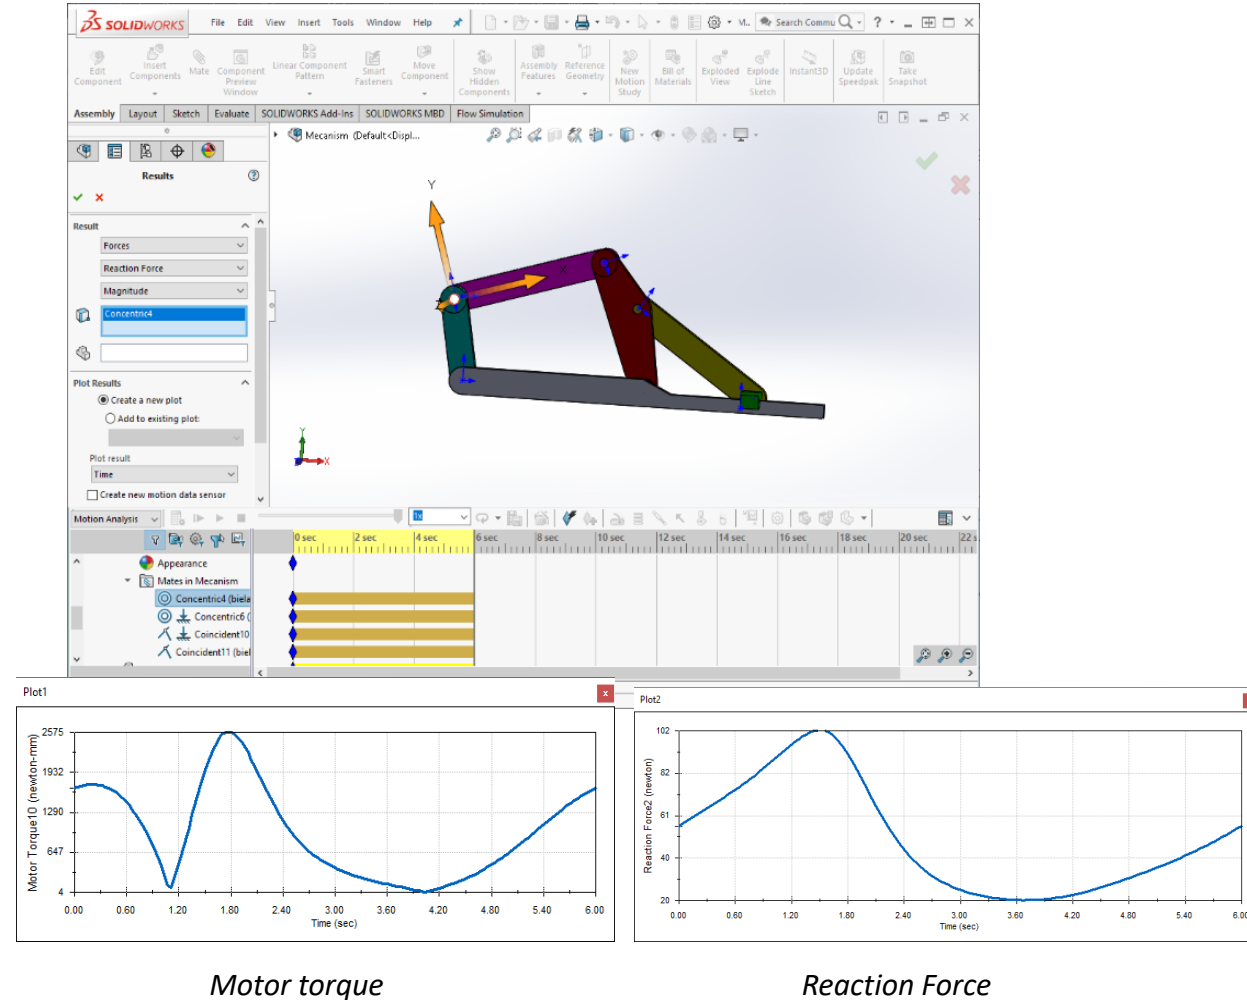

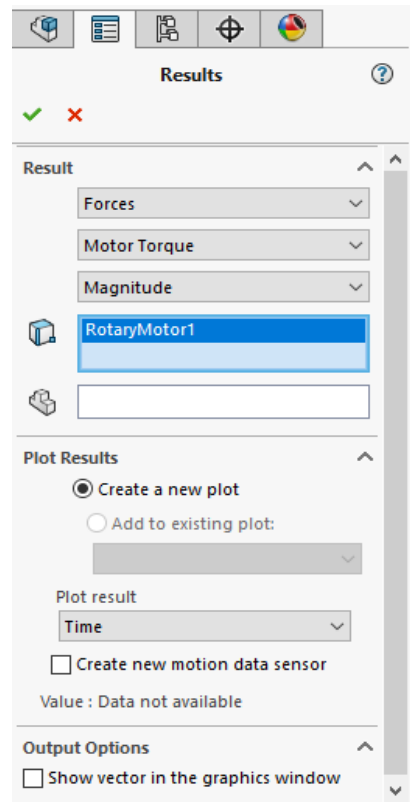

- Create a new animation using the **Motion Analysis** tool
- Insert a **Rotary motor** in joint O that has a rotational velocity of 10 rpm and rotates clockwise
- Apply a **Force** that acts on the kinematic element 5 with a magnitude of 100 N

Part dimensional optimization using FEA

□ Example

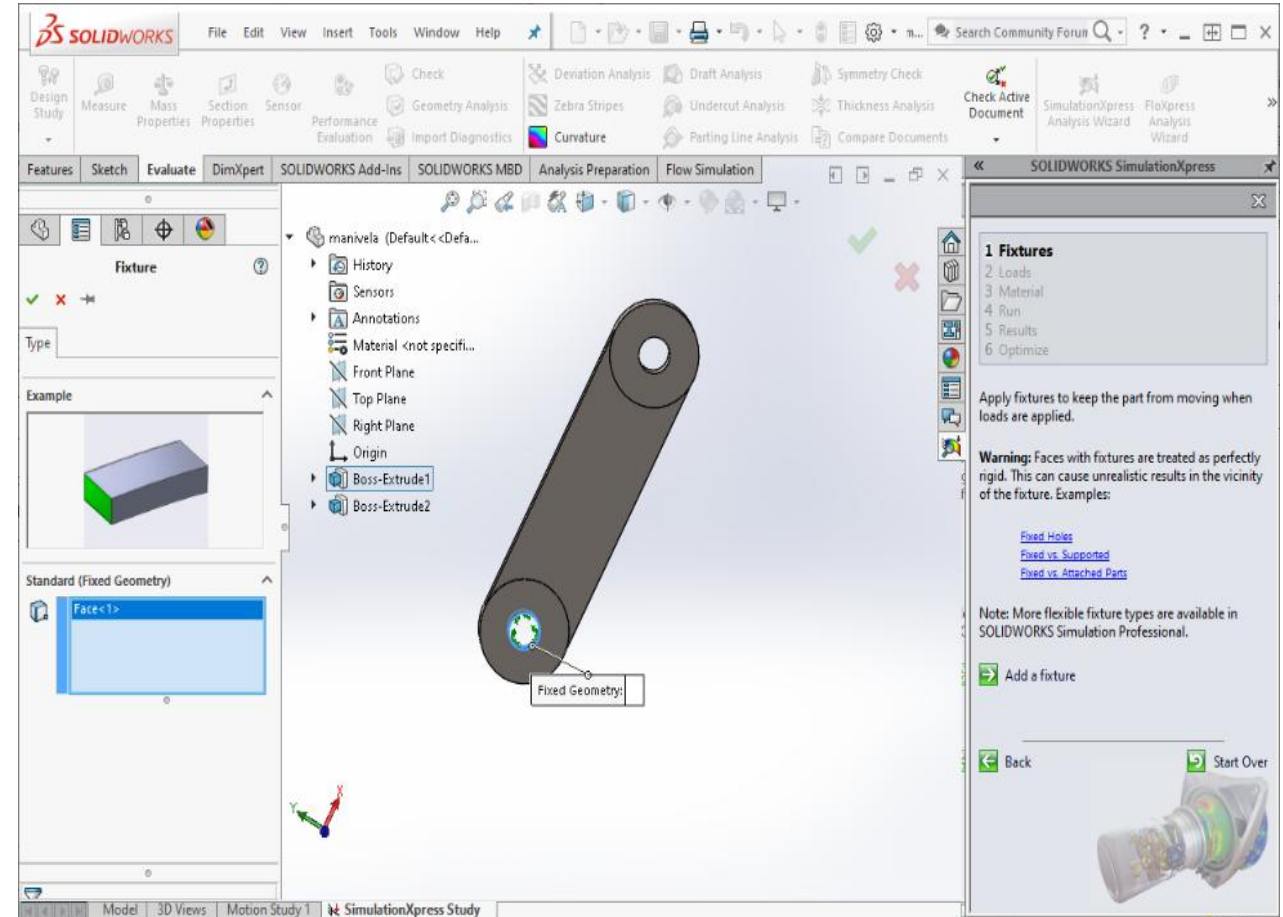

- Use the Plot command to determine:
 - The **Motor torque** required for a full cycle
 - The **Reaction force** at joint A
- Note :
 - $\text{Max } F_A = 102.2 \text{ [N]}$
 - $\text{Max } N_m = 2577.2 \text{ [Nmm]}$

Part dimensional optimization using FEA

□ Example

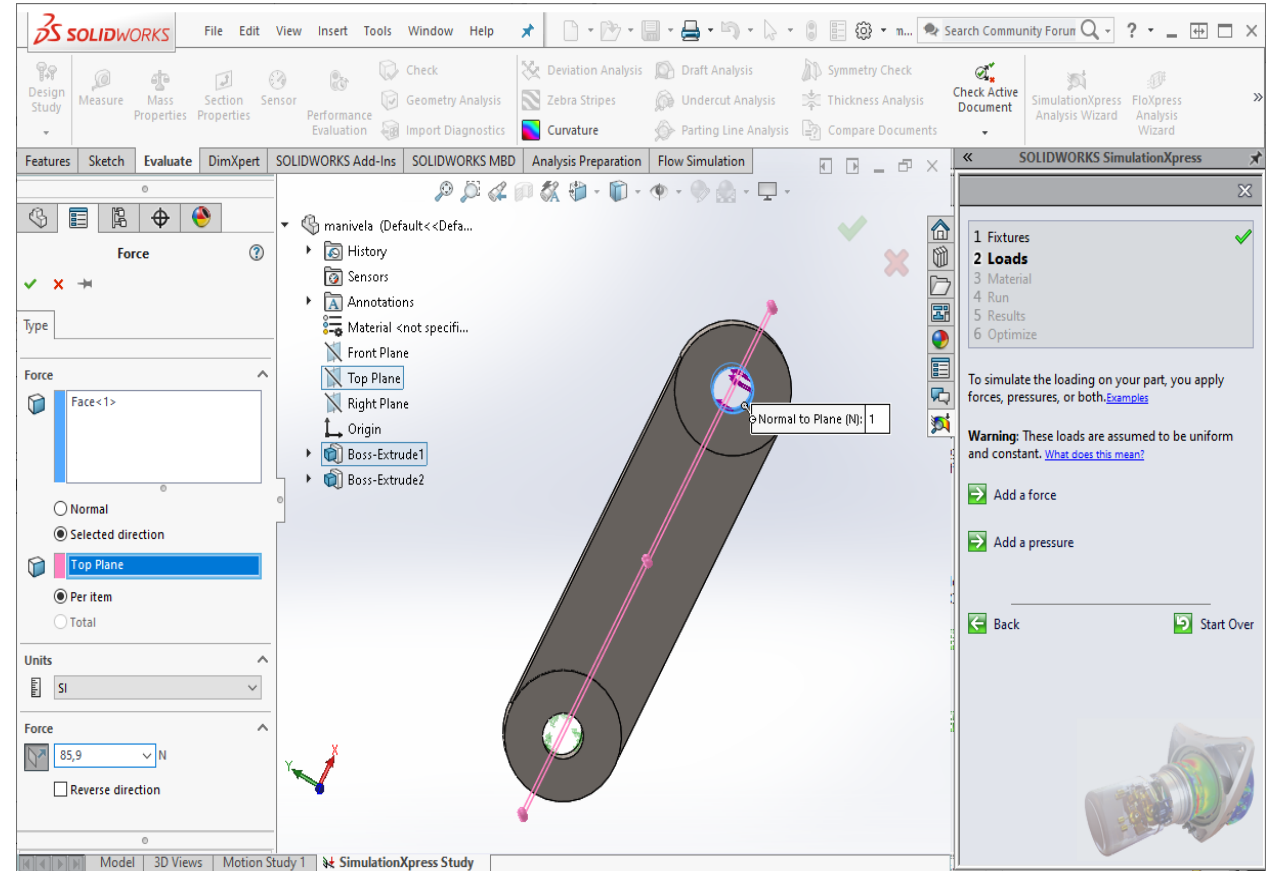

- **Optimization** of the geometric dimension of kinematic element 1
 - Define the fixtures

Part dimensional optimization using FEA

Example

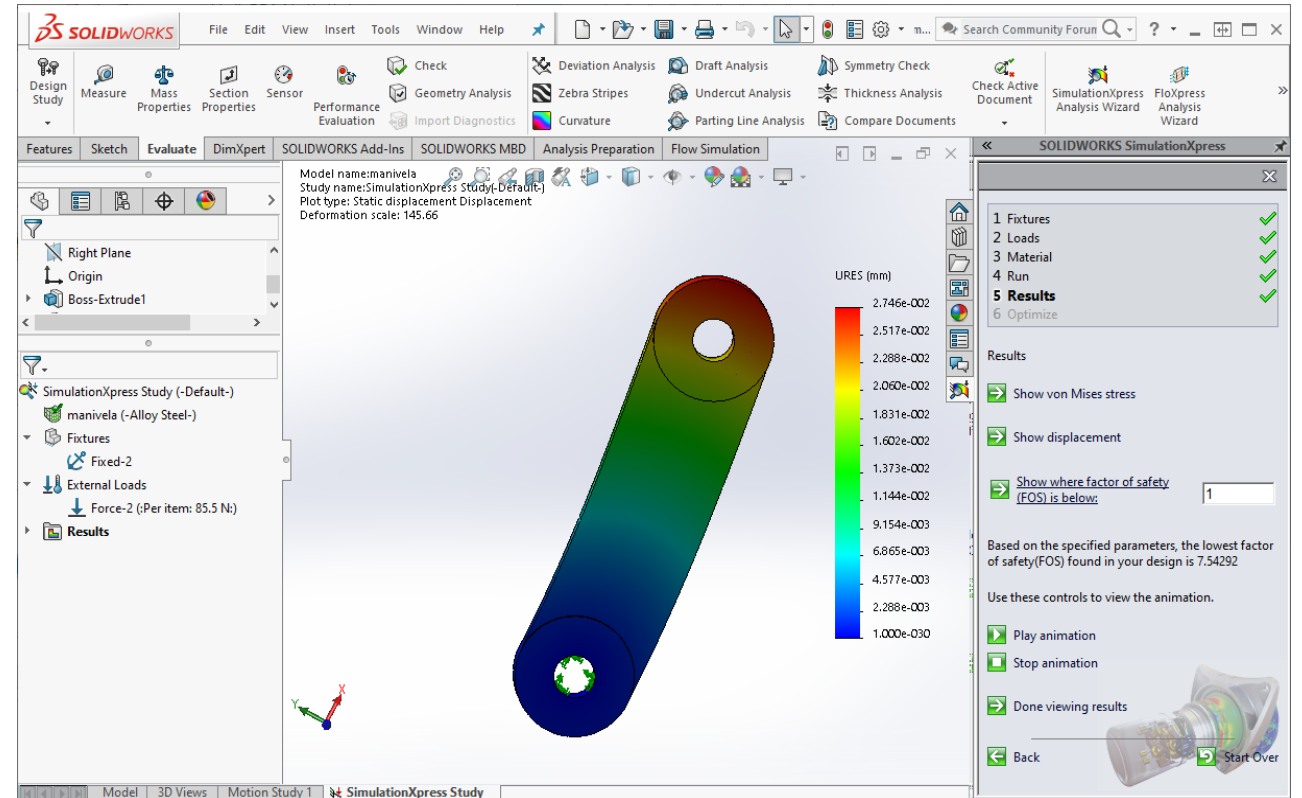

- **Optimization** of the geometric dimension of kinematic element 1
 - Define the fixtures
 - Define the Force acting on Joint A
 - Force magnitude $F_A=85.9[\text{N}]$.

Part dimensional optimization using FEA

□ Example

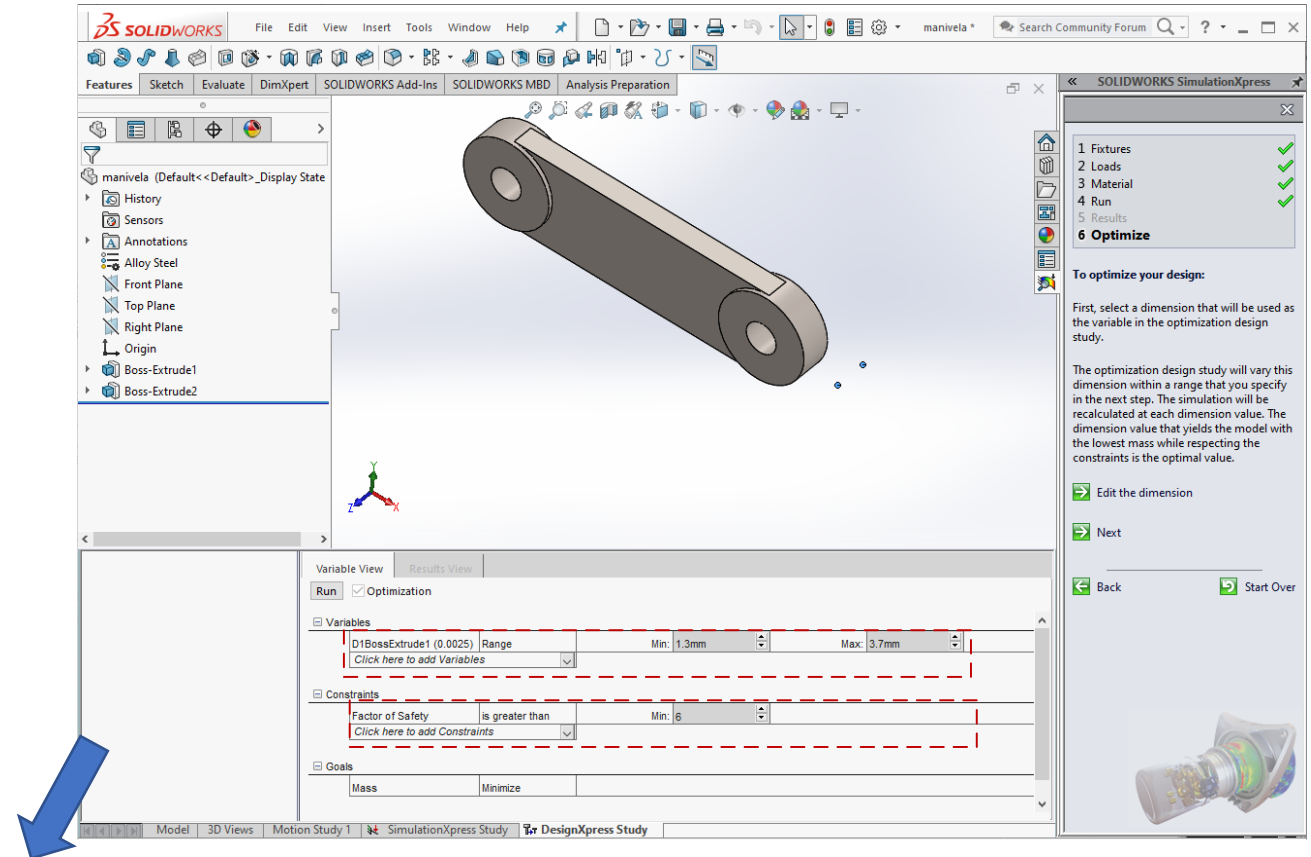

- **Optimization** of the geometric dimension of kinematic element 1
 - Define the fixtures
 - Define the Force acting on Joint A
- FEA analysis
 - Safety factor 7.54
 - Displacement 0,0275 [mm]

Part dimensional optimization using FEA

Example

- Optimization of the geometric dimension of kinematic element 1
 - Define the fixtures
 - Define the Force acting on Joint A
 - FEA analysis
 - Geometric optimization of the element
 - Variable – part width
 - Constraints – safety factor (min): 6

	Initial	Optimal
D1BossExtrude1 (0.00179033)	2.5mm	1.79033mm
Factor of Safety	7.444344	6.013676
Mass	0.00797783 kg	0.00601447 kg

About NextGEng Project

- **NextGEng Project** aims to create new pedagogical models that promotes international team-teaching with the support of new learning materials for existing courses in the curricula

NextGEng comprises three types of activities

Parametric Design with CATIA

The main objective of this presentation is to introduce and explain the concepts and techniques of parametric design within the context of the CATIA software.

Parametric Design with CATIA

Upon completion of this module, the student will be able to:

- 1) Understand CAD parametric design principles and concepts;
- 2) Capture and utilize engineering knowledge in CAD environments;
- 3) Gain insight into CATIA functionalities, particularly in parametric modeling;
- 4) Develop awareness of eco-friendly engineering concepts and their importance in modern product design;

Introduction

What is Parametric Design?

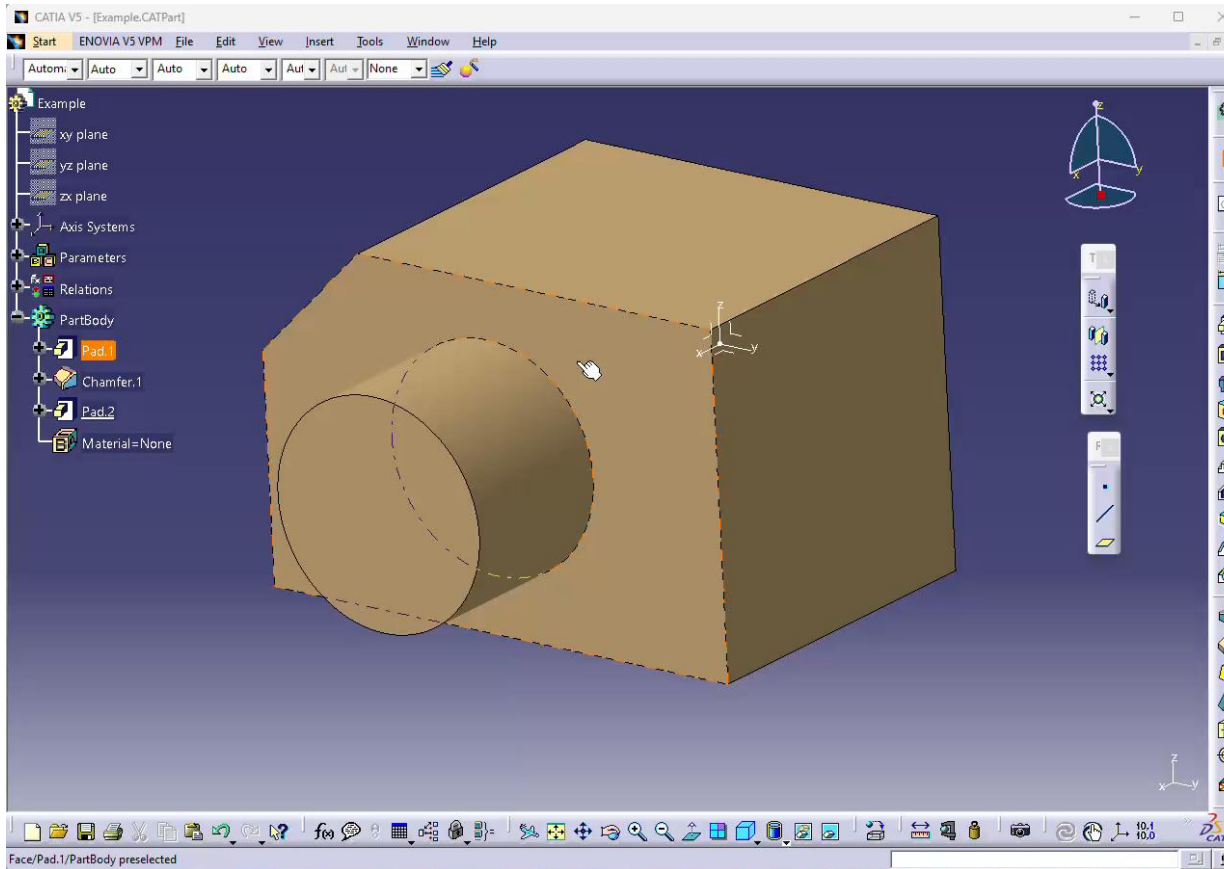

- Parametric design is a method of creating 3D models using computer-aided design (CAD) software where the geometry is defined by parameters and relationships rather than fixed dimensions.
- The design automation capabilities of parametric modeling software mean that designers do not have to redraw a design each time the dimensions of a model change
- Parametric design empowers designers to focus on the design intent rather than the manual creation of shapes.

How it works?

- **Fixed dimensions:** Geometries are created with specific, fixed dimensions rather than variable parameters.
- **Direct manipulation:** Users directly modify the geometry by selecting and editing faces, edges, or vertices.
- **Independent elements:** Parts of the model are generally not relationally linked, so changes to one element don't automatically update others
- **Limited flexibility:** More challenging to make sweeping changes or create design variations

How it works?

- **Parameters:** These are the variables that define the design, such as dimensions and sometimes relationships between elements.
- **Rules:** These are the constraints or equations that govern how the parameters interact and influence the overall model.
- **Algorithms:** The CAD software uses these parameters and rules to generate the 3D model.

Benefits of Parametric Design

This approach offers several advantages over traditional CAD methods, including:

- **Efficiency:** Quickly modify designs by changing parameters, without having to redraw everything.
- **Consistency:** Ensures that design intent is maintained throughout the modification process
- **Relational modeling:** Elements of the design are related to each other, so changes in one part can automatically update connected parts.
- **Automation:** Repetitive design tasks can be automated, saving time and reducing errors.
- **Design exploration:** Easily create multiple design variations by adjusting parameters

Traditional Design vs. Parametric Design

	Traditional Design	Parametric Design
1. Design philosophy:	Direct manipulation of geometry	Design driven by parameters and relationships
2. Flexibility:	Less flexible; major changes often require rebuilding	Highly flexible; easy to modify designs by adjusting parameters
3. Design intent:	Design intent not explicitly captured	Design intent is built into the model
4. Speed:	Often faster for simple designs	Slower for simple tasks due to setup time
5. Learning curve:	Generally easier to learn initially	Steeper learning curve, but more powerful after mastering it
6. Industry usage:	Still common, especially for simpler parts	Widely adopted in complex products or frequent design changes

CAD software packages

	Stand-alone	Cloud based
	CATIA V5, CATIA V5-6 SolidWorks	CATIA V6 (3DEXPERIENCE)
	Inventor	Fusion 360
	Creo (formerly Pro/ENGINEER)	Onshape
	NX (formerly Unigraphics) SolidEdge	-

Parametric design capabilities in CATIA

- The 2D sketching tool is fully parametric, allowing for the creation of constrained, dimension-driven sketches
- CATIA's Part Design workbench allows for the creation of fully parametric 3D models. Features can be defined using parameters, formulas, and rules.
- Users can create reusable design templates that capture design intent and engineering knowledge
- Parts can be related to each other, so changes in one part can drive changes in others.
- Product Engineering Optimizer enables optimization of designs based on defined parameters and constraints.
- CATIA supports various programming languages for automating parametric design tasks
- Parametric models in CATIA can be integrated with PLM (Product Lifecycle Management) systems for comprehensive product development

Relations and Parameters in CATIA

Co-funded by
the European Union

Co-funded by
the European Union

Relations and Parameters in CATIA

Formulas and Relations are essential tools in CATIA for defining relationships between geometric elements, parameters, or dimensions. Despite their apparent similarities, they have different functions

Formulas:

- are used to calculate values based on existing data
- typically involves mathematical expressions using operators like +, -, *, /, and functions (e.g., SIN, COS, TAN, etc.).

Relations:

- are used to define and maintain geometric relationships between elements
- can include conditional statements (e.g., IF-THEN-ELSE) to perform different calculations based on specific conditions

Relations and Parameters in CATIA

Parameters: are variables that can be modified to change the geometry or behavior of a design.

Key characteristics:

- can be assigned different values, allowing for variations in the design
- can be related to each other using formulas or relations, creating dependencies between design elements
- used to capture the design intent, making it easier to understand and modify the model
- can be used to automate design processes, such as creating a series of parts with varying dimensions.

Design intent

The key to building parametric, feature-based, solid models is to ensure that they have a flexible and predictable behavior. This process is known as capturing ***design intent***.

Key aspects:

- **Purpose:** The overall goal or objective of the design.
- **Relationships:** The relationships between different design elements and how they contribute to the overall functionality.
- **Constraints:** The limitations or restrictions that must be considered during the design process.
- **Design logic:** The underlying principles or rules that govern the design

Design intent

Example: Part with a hole.

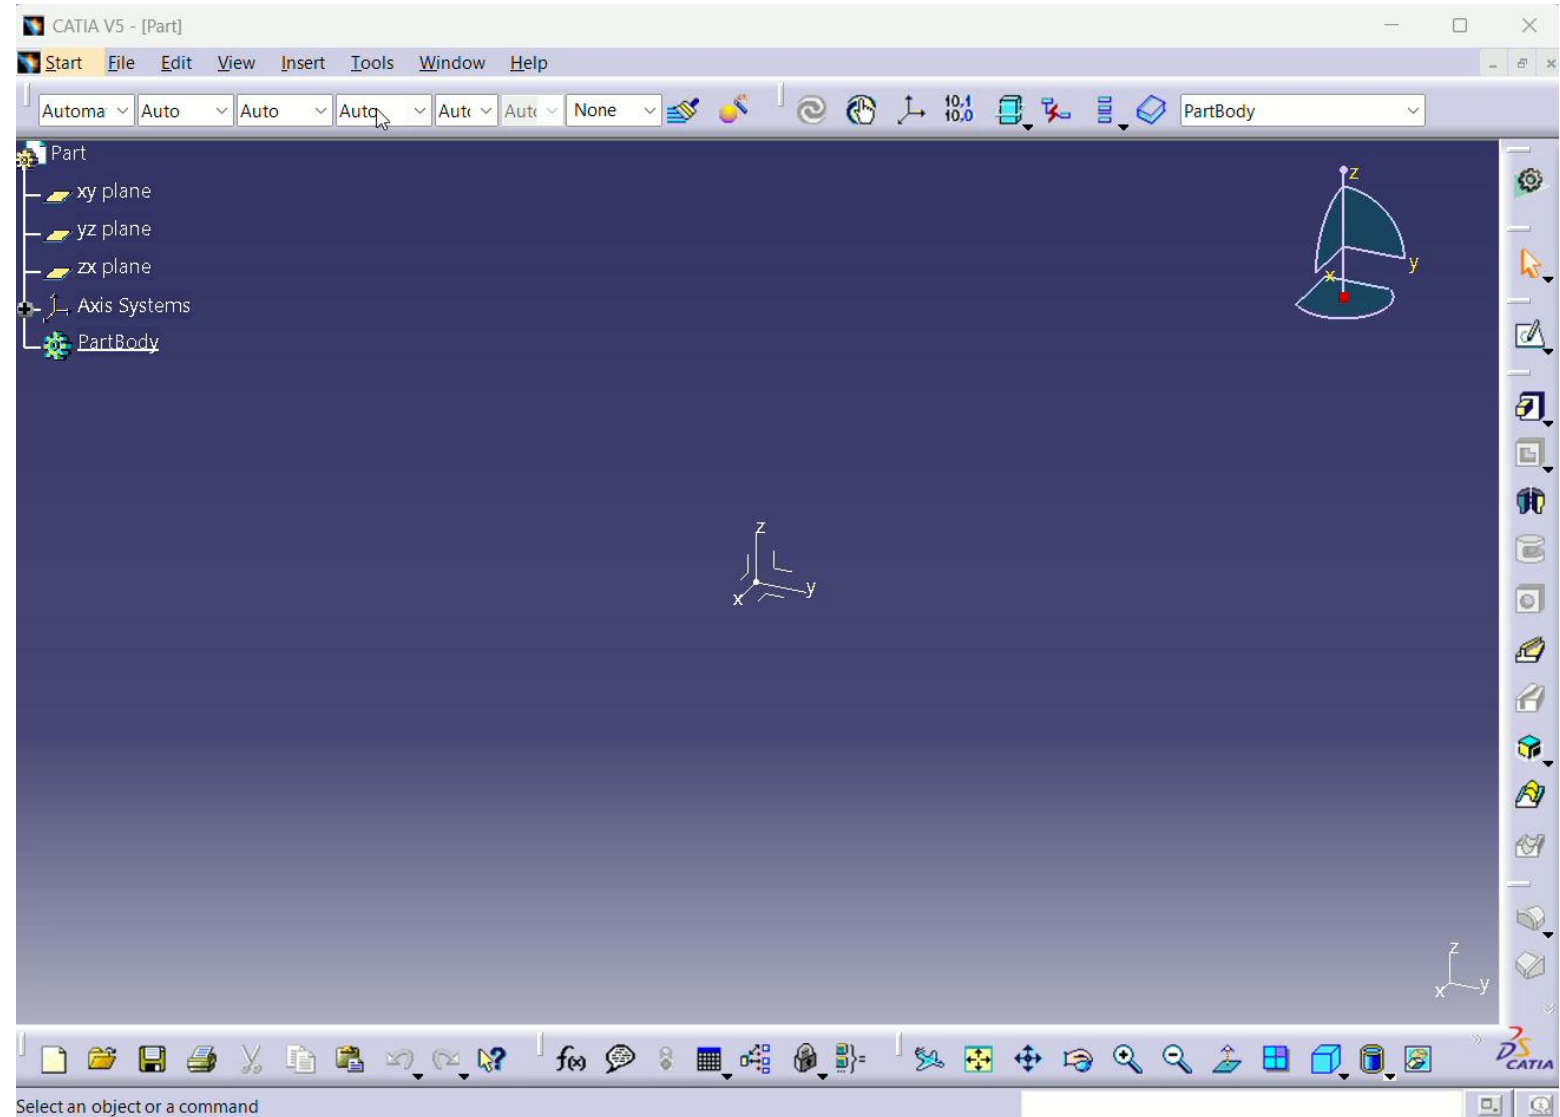

When part's length increases the design intent of the hole determines how it behaves

Tree visualization:

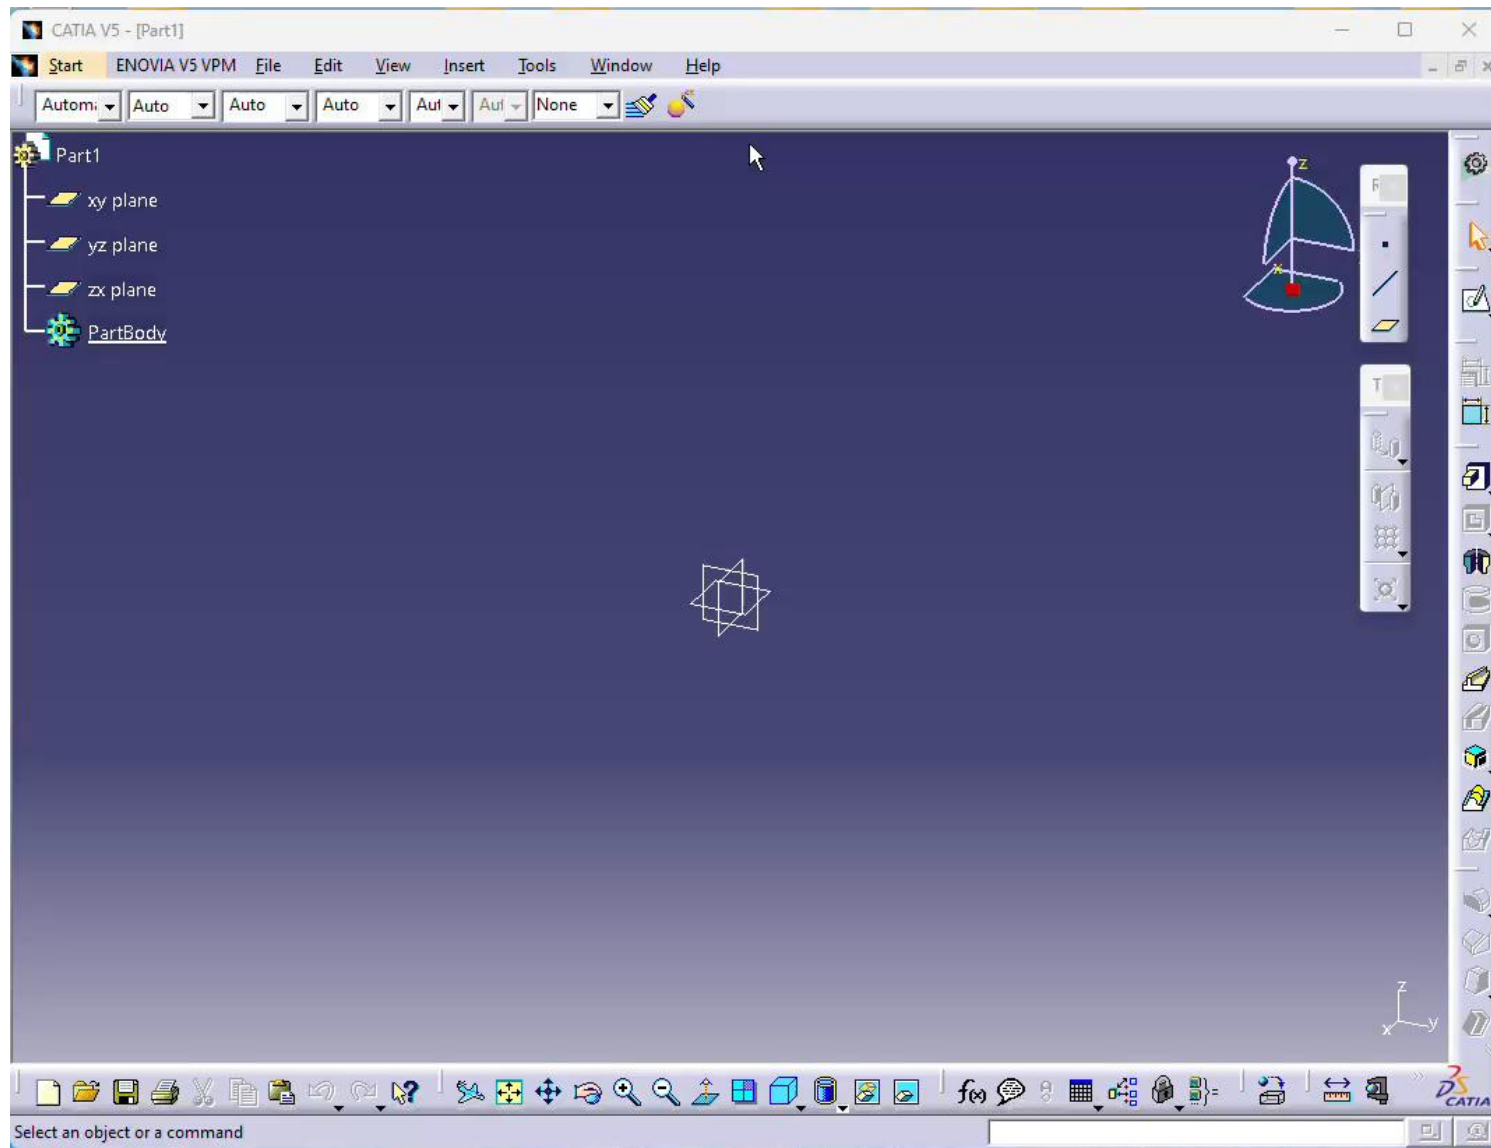

Tools -> Options:

- General-> Parameters and Measure-> Knowledge: Parameter Tree View
- Infrastructure-> Part Infrastructure-> Display: Display in Specification Tree

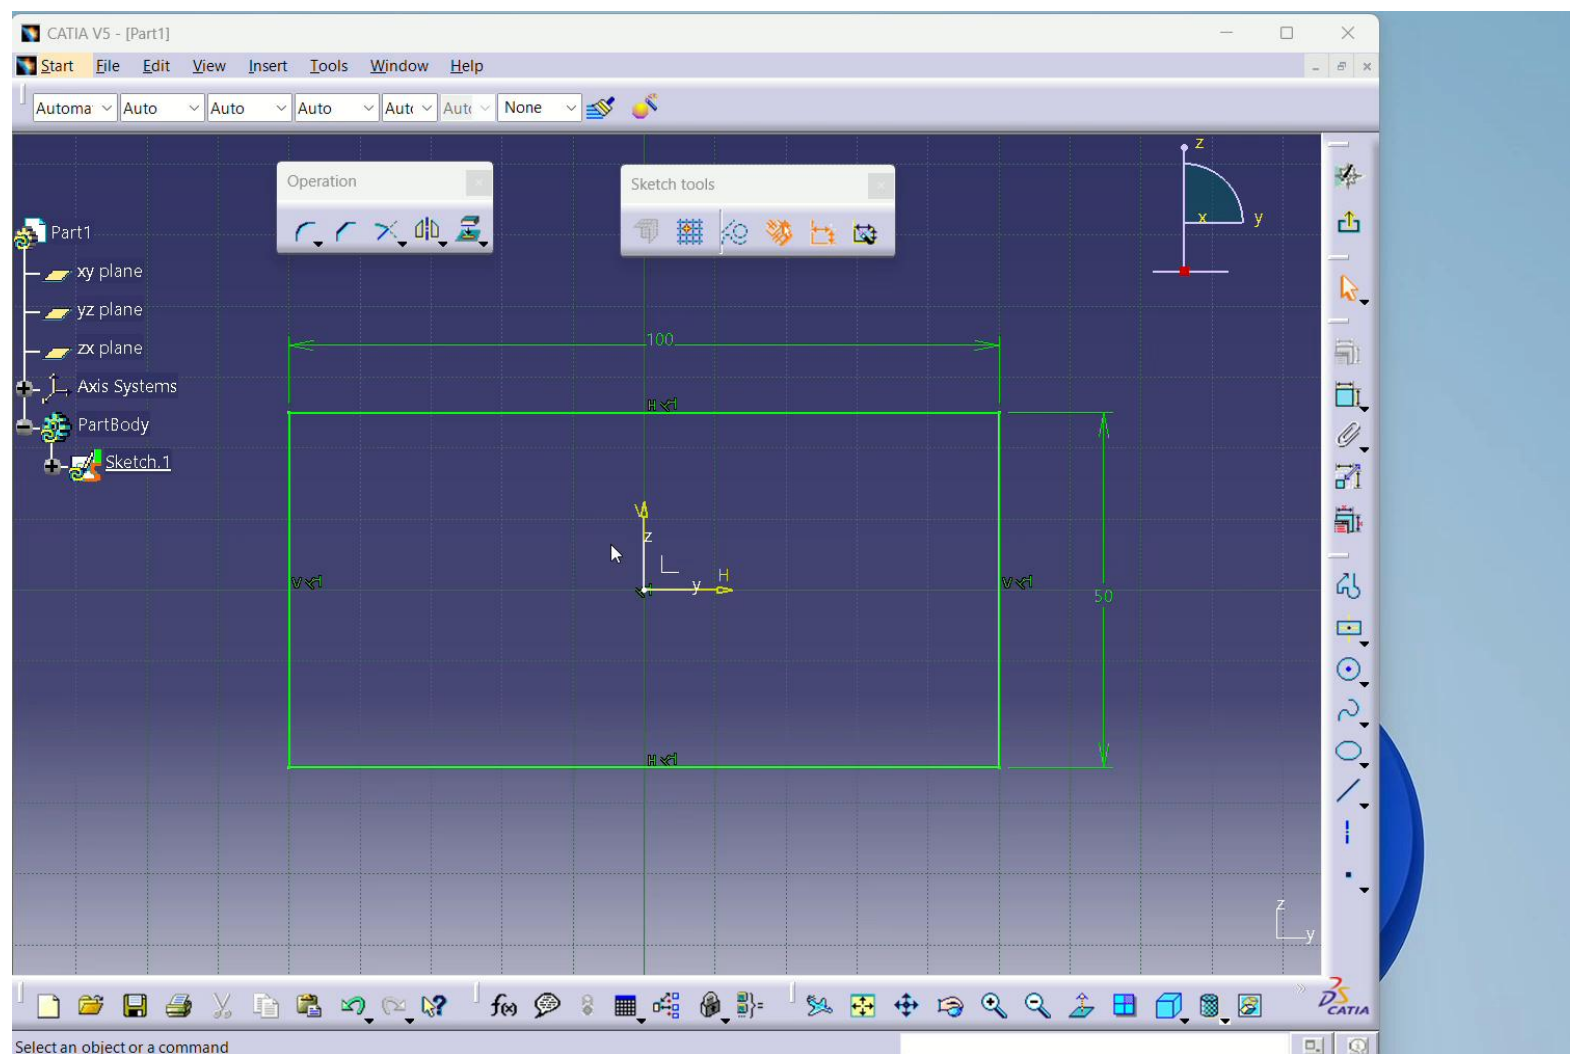

Types of Parameters:

- **Numeric parameters (Real or Integer):** such as length, width, height, angle, or radius.
- **Text parameters (String):** such as material names, part numbers, or descriptions.
- **Boolean parameters:** boolean values (true or false), which can be used to control the visibility of elements or activate certain design features.
- **Date/time parameters:**
- **Custom parameters:** are specific data types and properties to suit your design needs

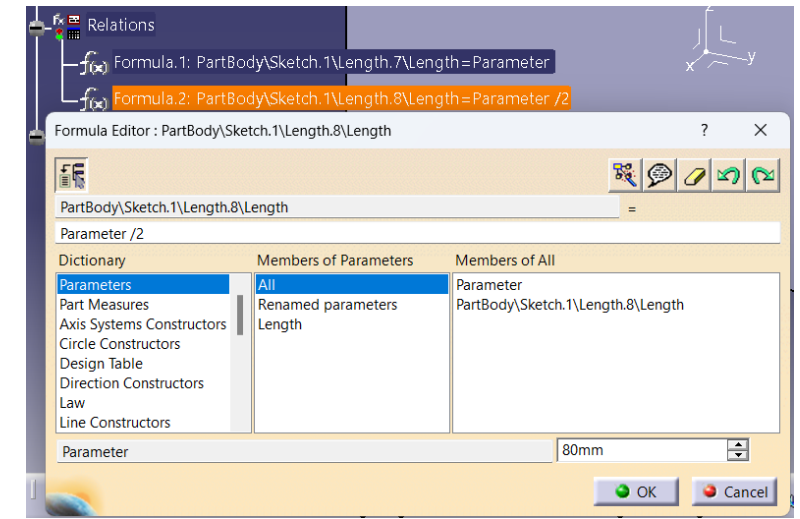

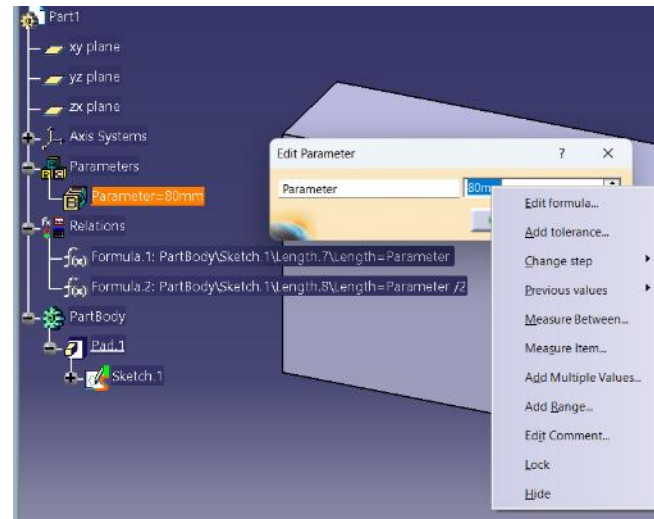

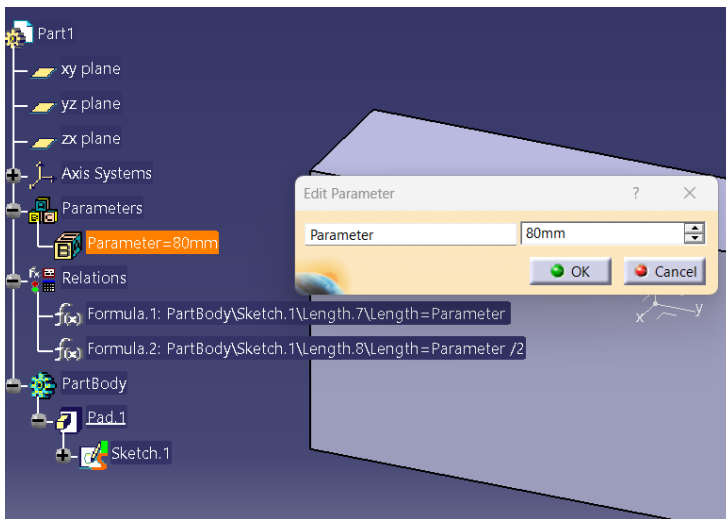

Define parameters and formulas

Edit parameters and formulas

- Double-click the parameter in the specification tree. The Edit Parameter window is displayed
- Right-click the value field and select one of the options available
- Double-click the formula in the specification tree. The Formula Editor window is displayed

Adding parameters and relations to a 3D Model

Objective: Change the part dimensions according to the central hole radius

Parameter [Length] : Hole_radius

Formulas: $H = \text{Hole_radius} * 4$

$L = \text{Hole_radius} * 5$

$D = \text{Hole_radius} * 2$

$C = \text{Hole_radius}$

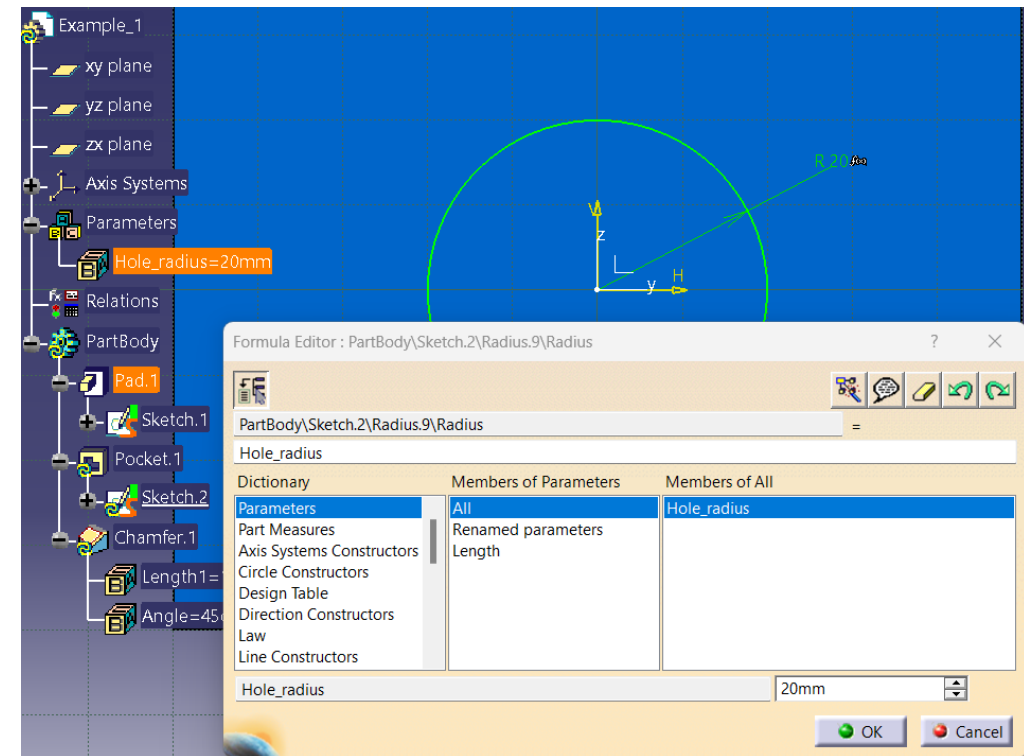

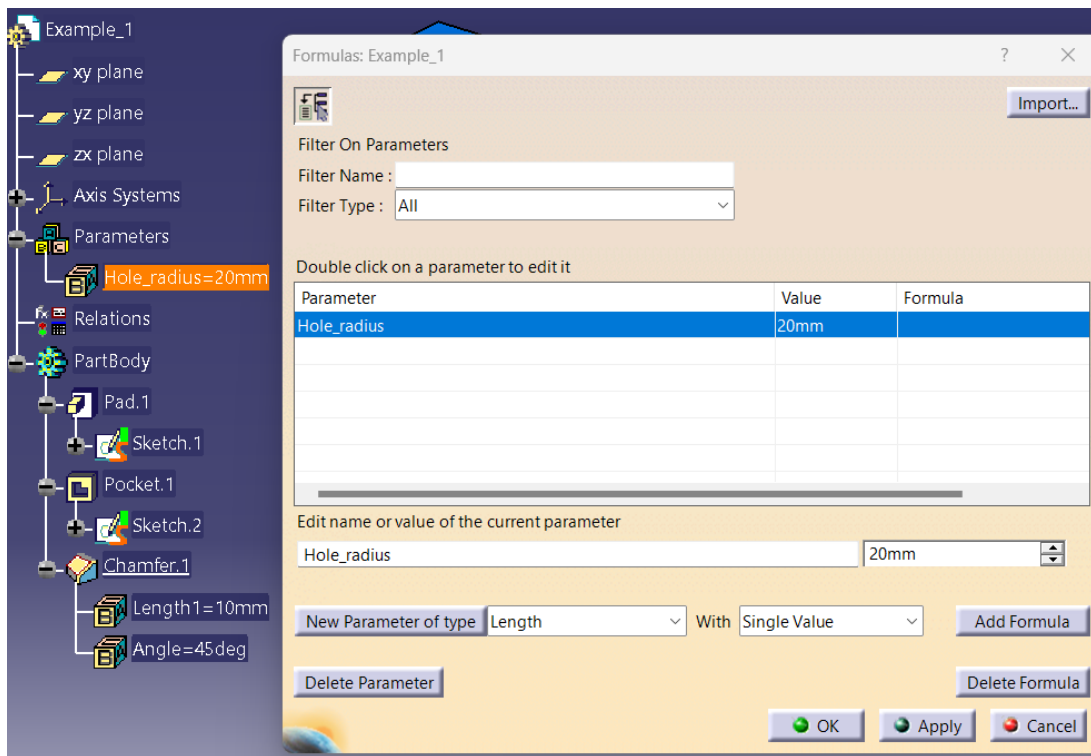

$P = \text{Hole_radius} * 2 - 10 \text{ mm}$

Adding parameters and relations to a 3D Model

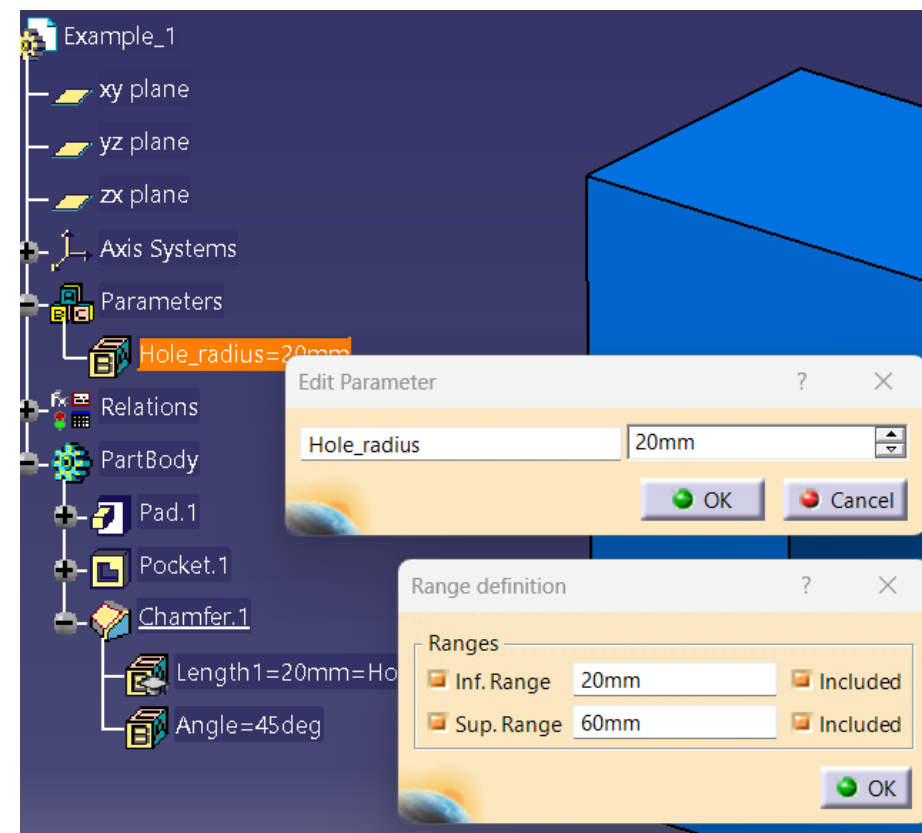

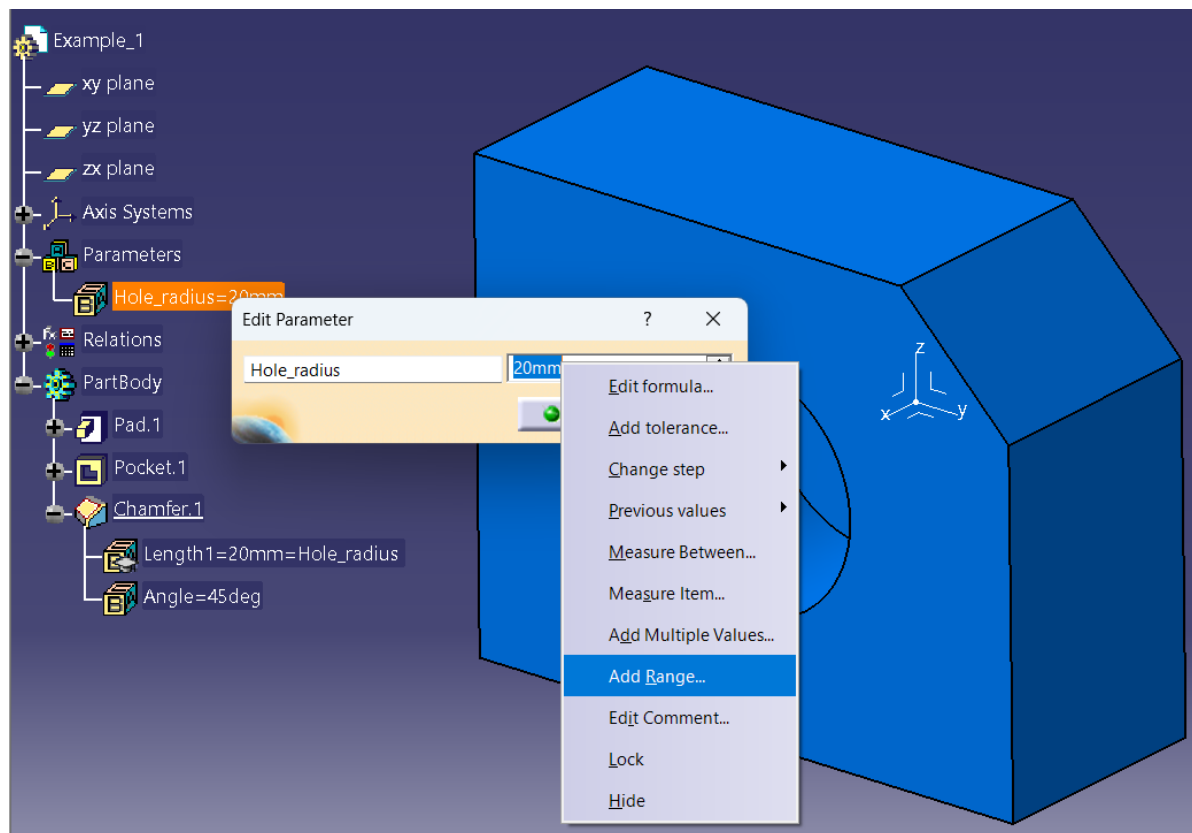

The Length parameter named Hole_radius is created. An initial value of 20 mm is assigned to it

The hole radius becomes equal to the value of the previously created parameter

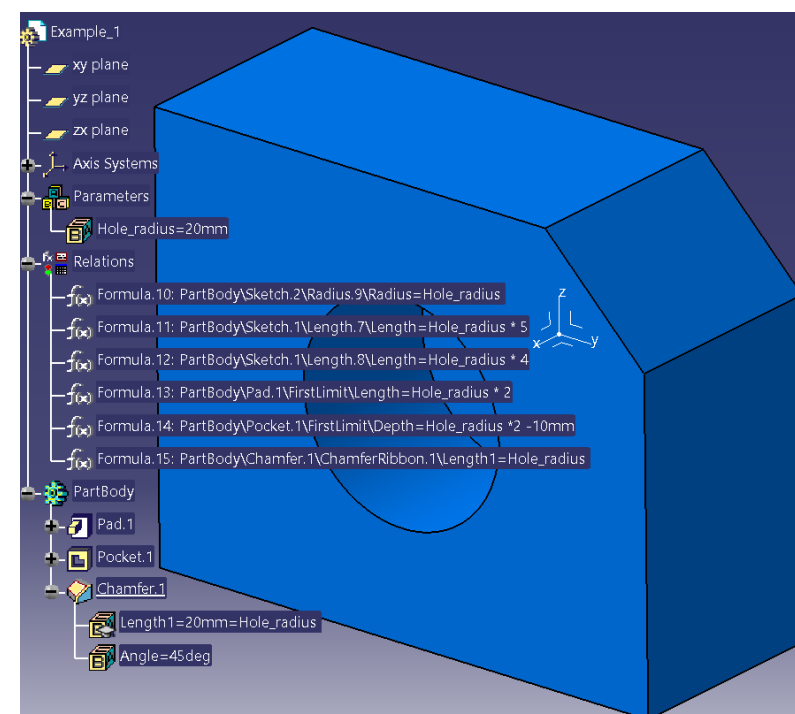

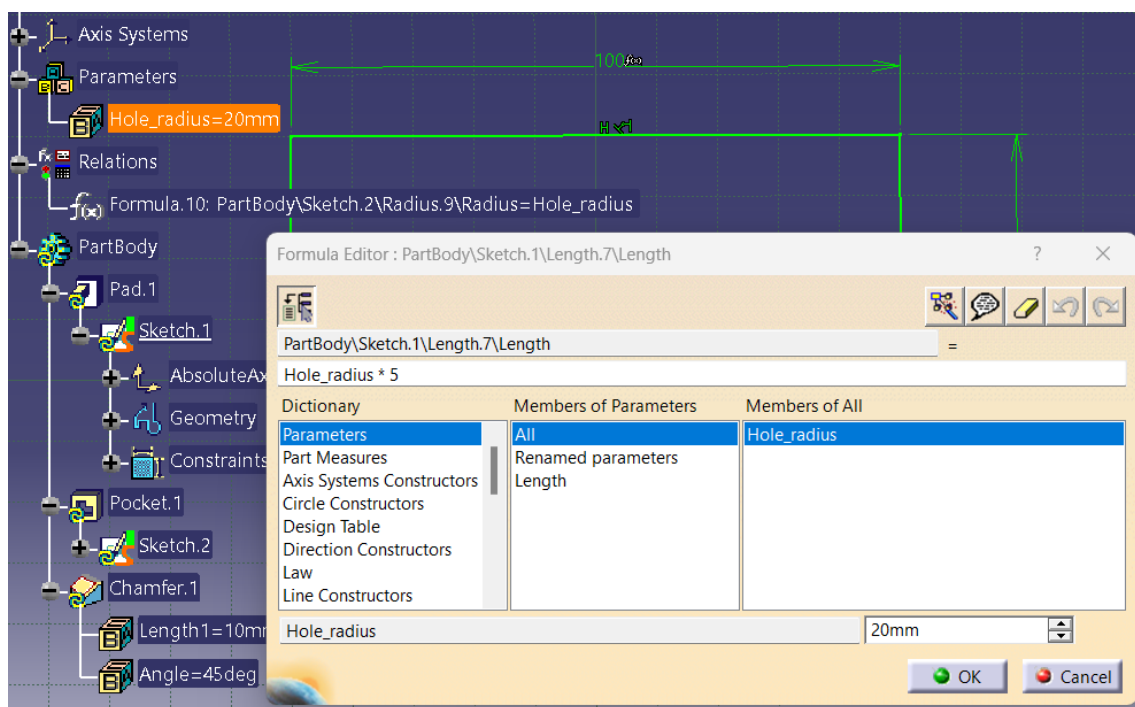

Adding parameters and relations to a 3D Model

We edit the parameter value to define the range of possible values (e.g. between 20 and 60 mm)

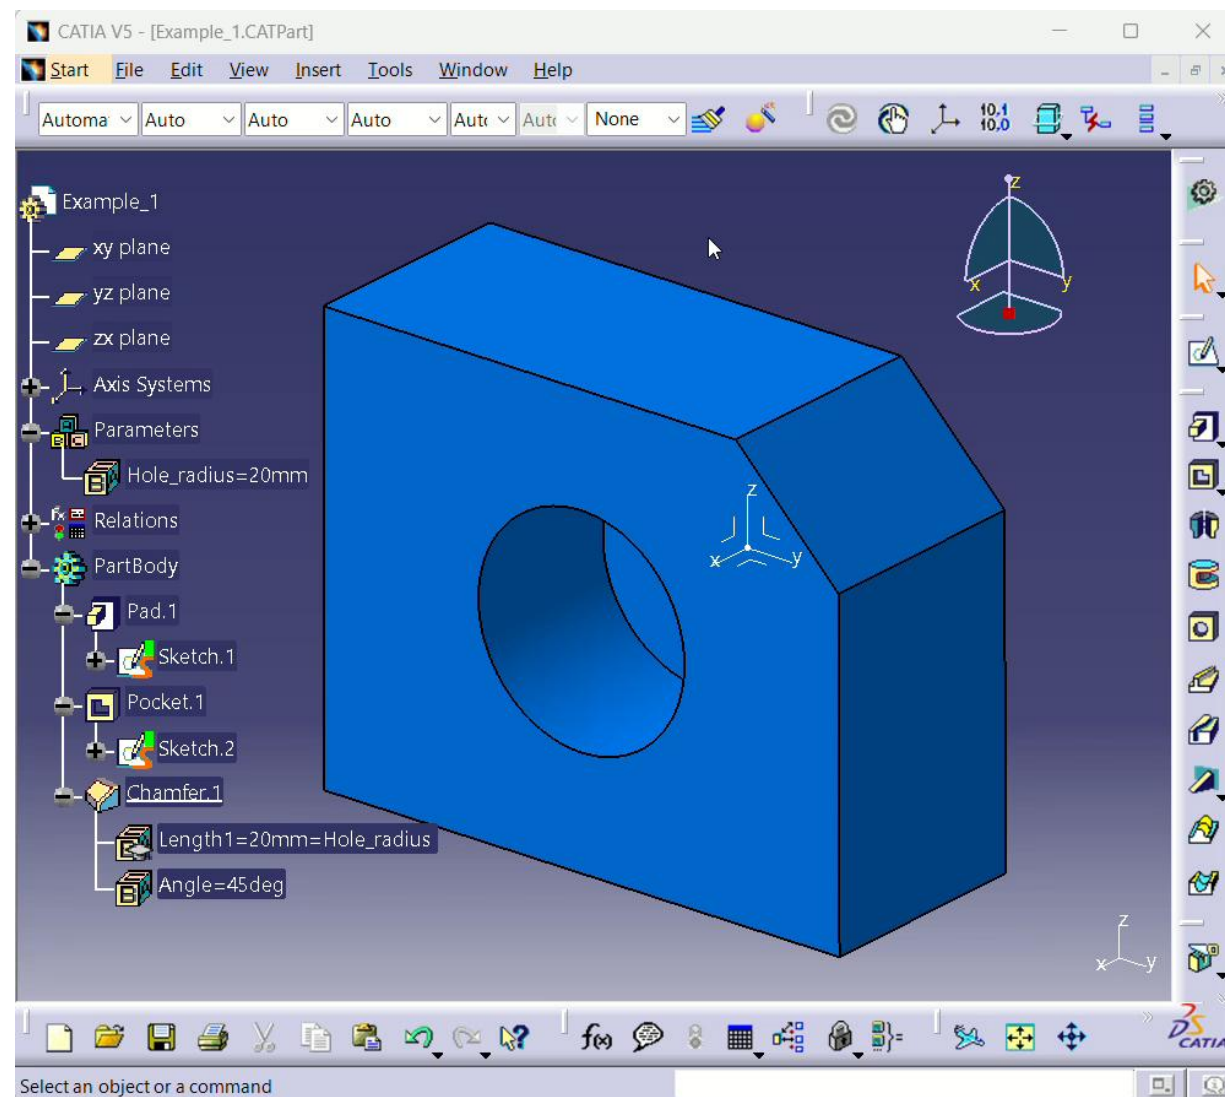

Adding parameters and relations to a 3D Model

Using the Formula Editor the Relations are defined for all model dimensions

Adding parameters and relations to a 3D Model

Adding conditional statements to a 3D Model

Conditional Statements (If-Else) in CATIA allow you to control the behavior of design elements based on specific conditions. Those can be implemented using CATIA V5's **Knowledge Advisor** workbench, which includes the Rule Editor.

Types of Conditional Statements in CATIA:

Basic:

```
IF condition
{
    Action1
}
ELSE
{
    Action2
}
```

Nested:

```
IF condition1
{
    Action1
}
ELSE IF condition2
{
    Action2
}
ELSE
{
    Action3
}
```

Adding conditional statements to a 3D Model

Objective: Change the flange dimensions and number of holes according to the bore radius (R).

Rules:

$R < 30 \text{ mm} \rightarrow 4 \text{ holes}$

$30 < R < 60 \text{ mm} \rightarrow 6 \text{ holes}$

$60 < R < 80 \text{ mm} \rightarrow 8 \text{ holes}$

Parameters [Length] : Bore_radius

[Integer] : Holes

Formulas: $A/2 = \text{Bore_radius} * 2.5$

$B/2 = \text{Bore_radius} / 5$

$D/2 = \text{Bore_radius} + \text{Bore_radius} / 2.5$

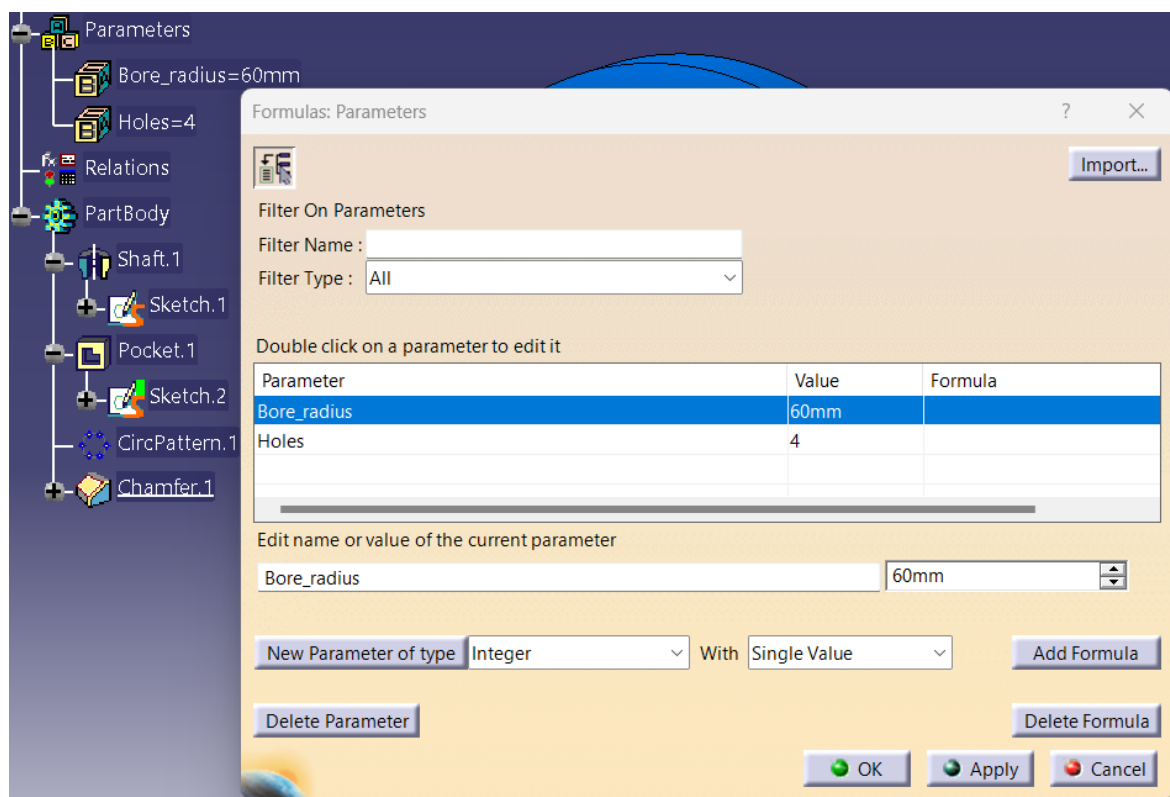

$C = D/2 + 20\text{mm}$

$E = \text{Bore_radius} / 2.5$

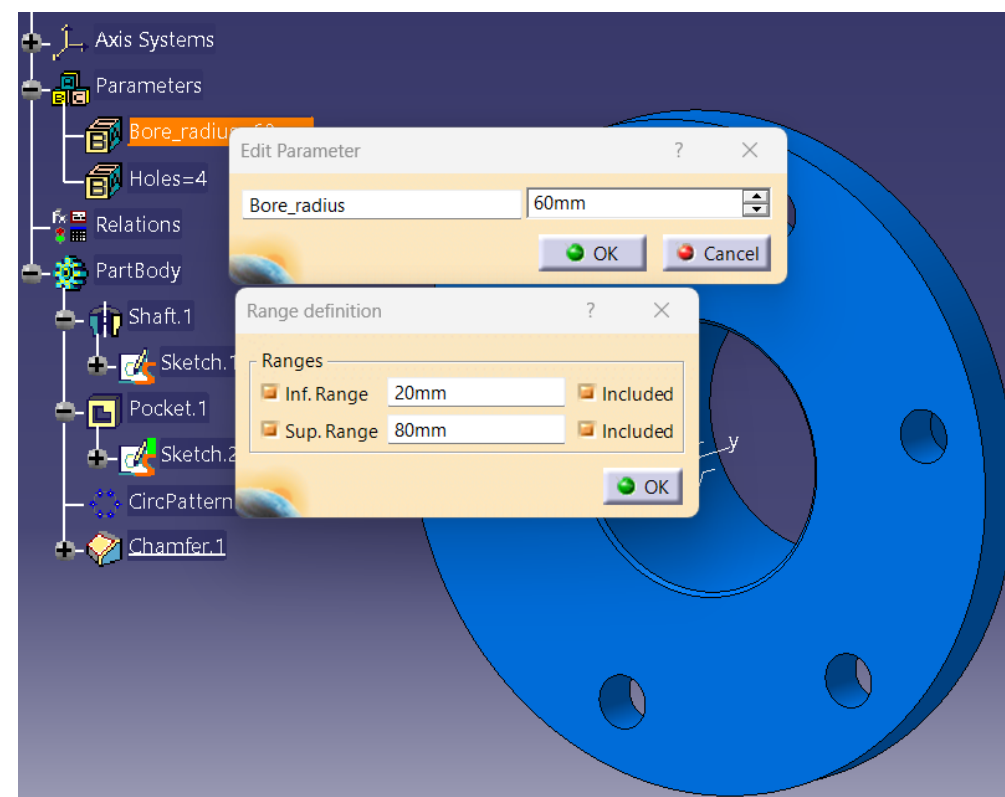

Adding conditional statements to a 3D Model

The two necessary parameters are created. One of type **Length** and the other of type **Integer**

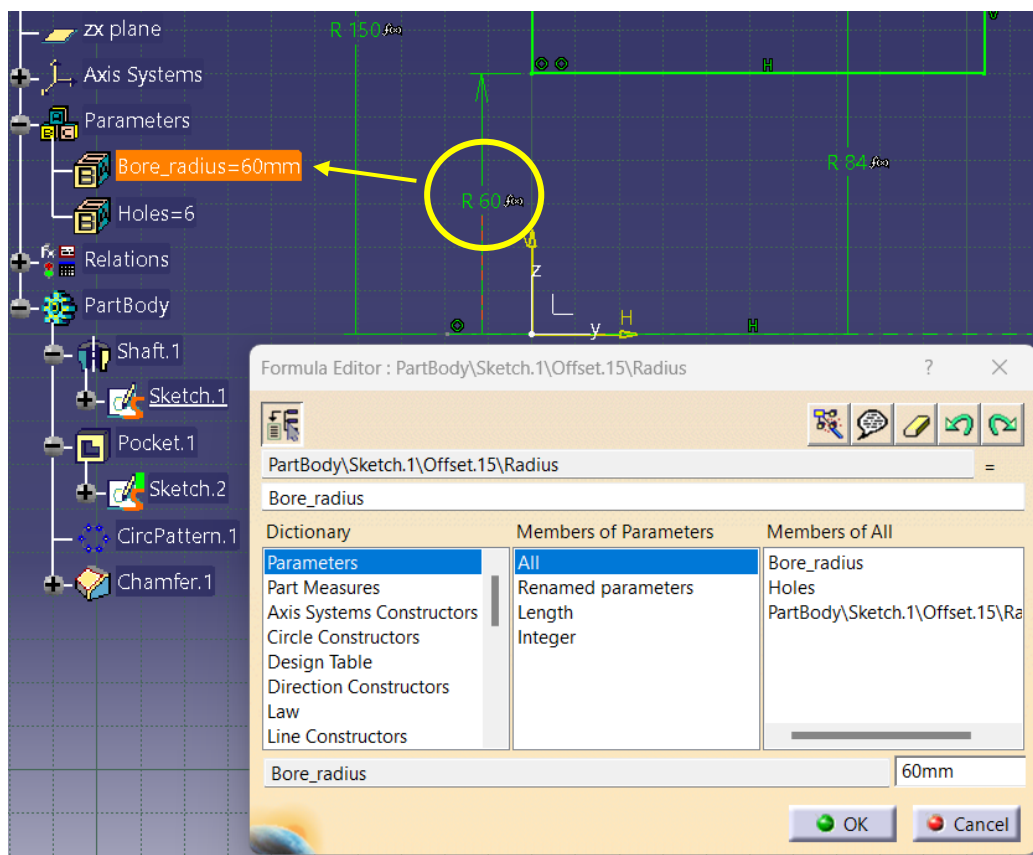

We edit the parameter value to define the range of possible values (e.g. between 20 and 80 mm)

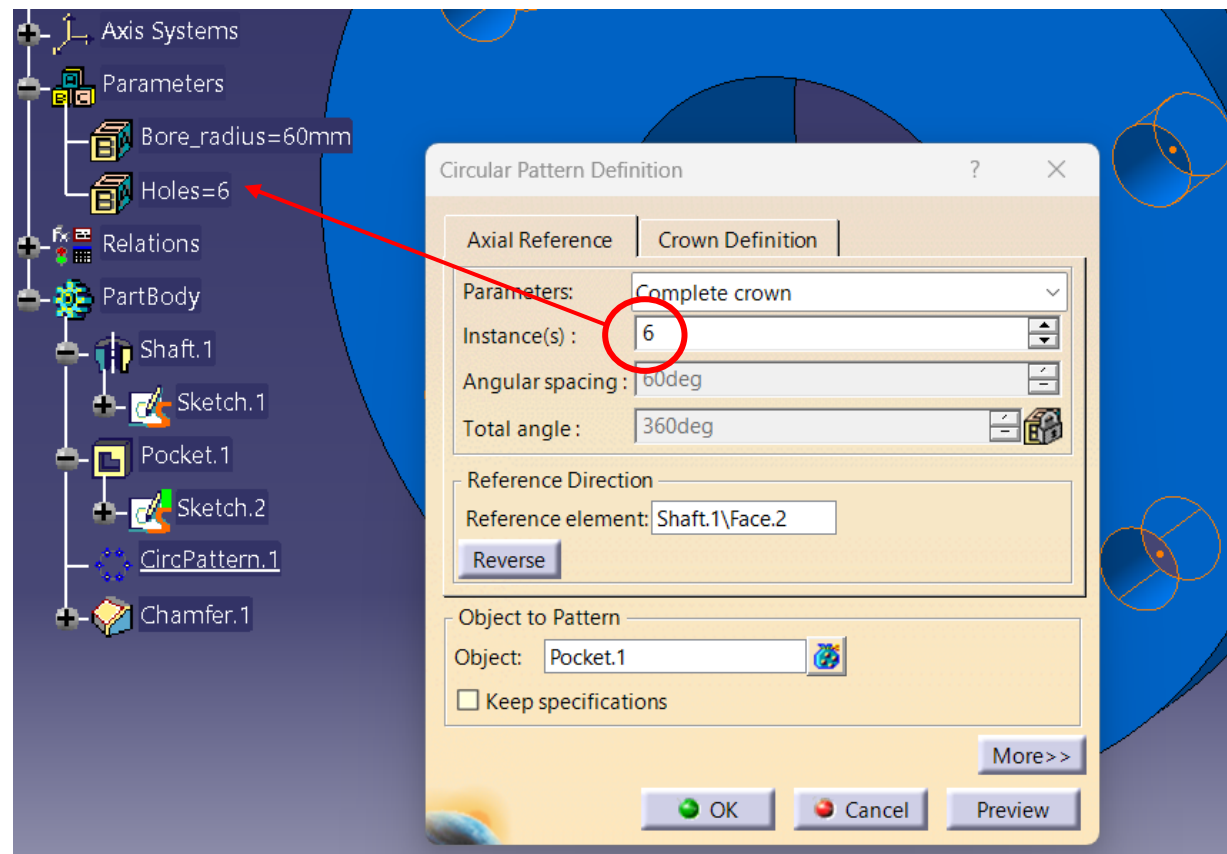

Adding conditional statements to a 3D Model

The bore radius becomes equal to the value of the **Bore_radius** parameter

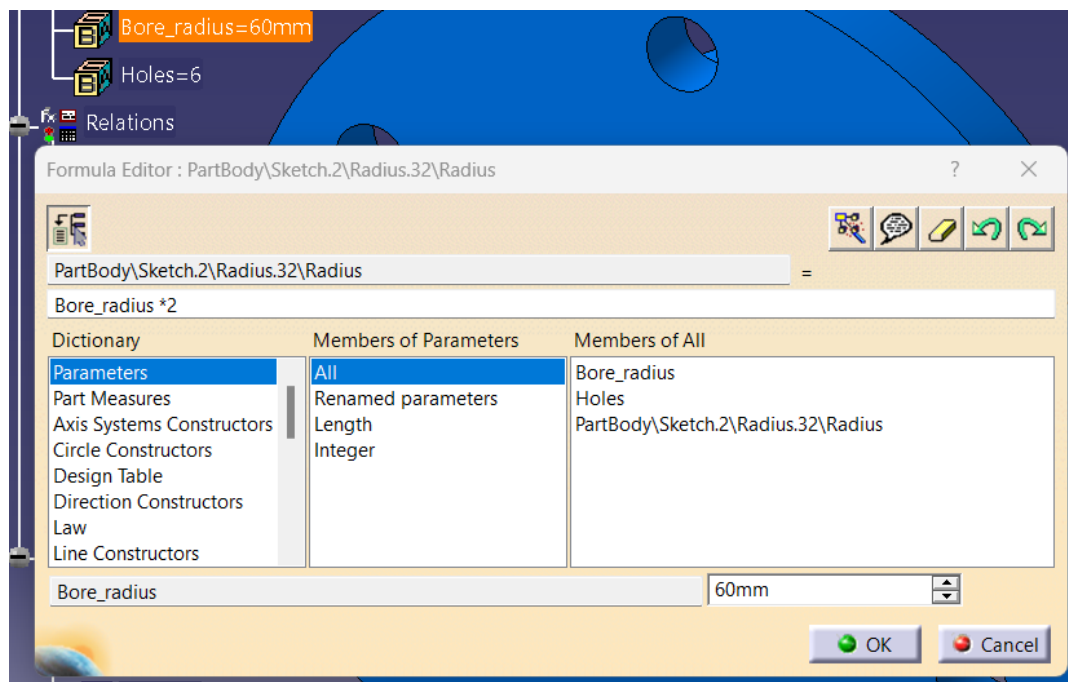

The number of the Instances becomes equal to the value of the **Holes** parameter

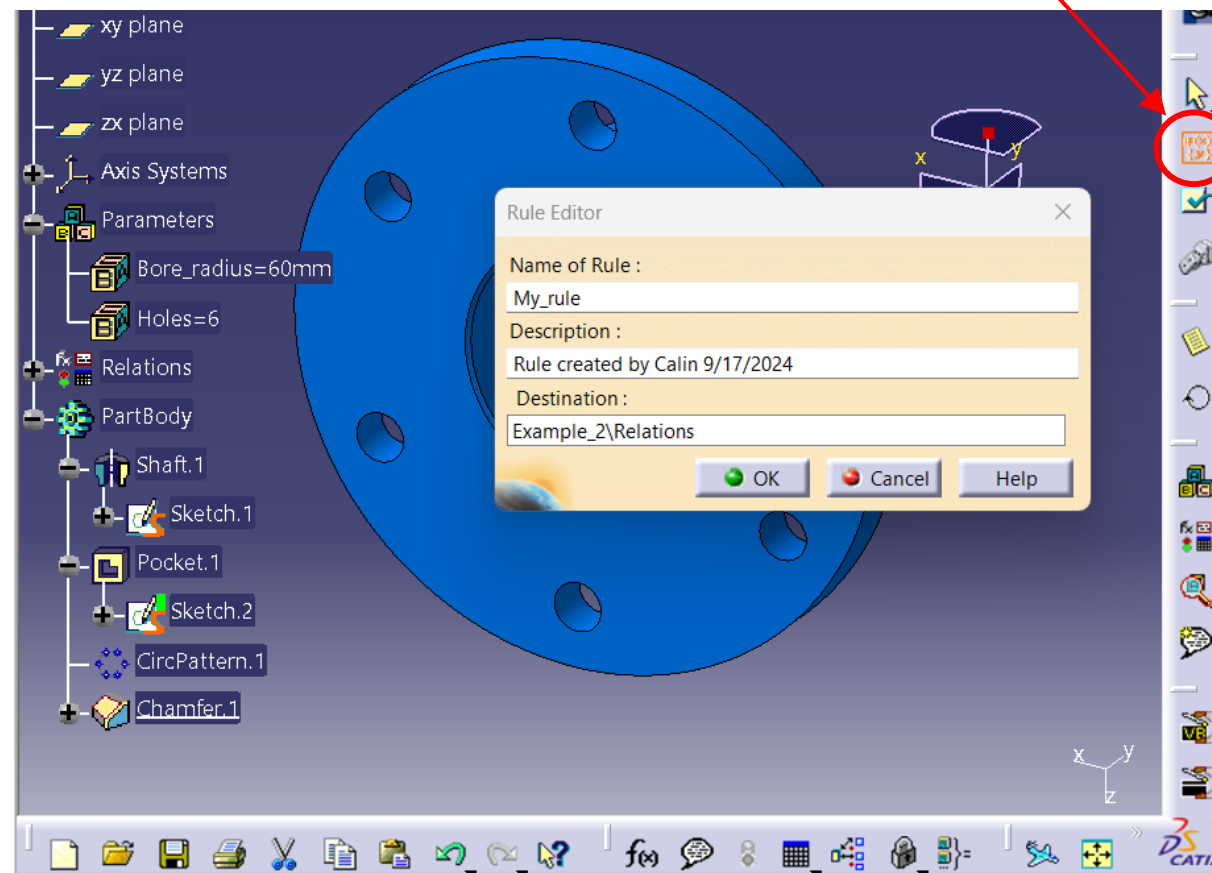

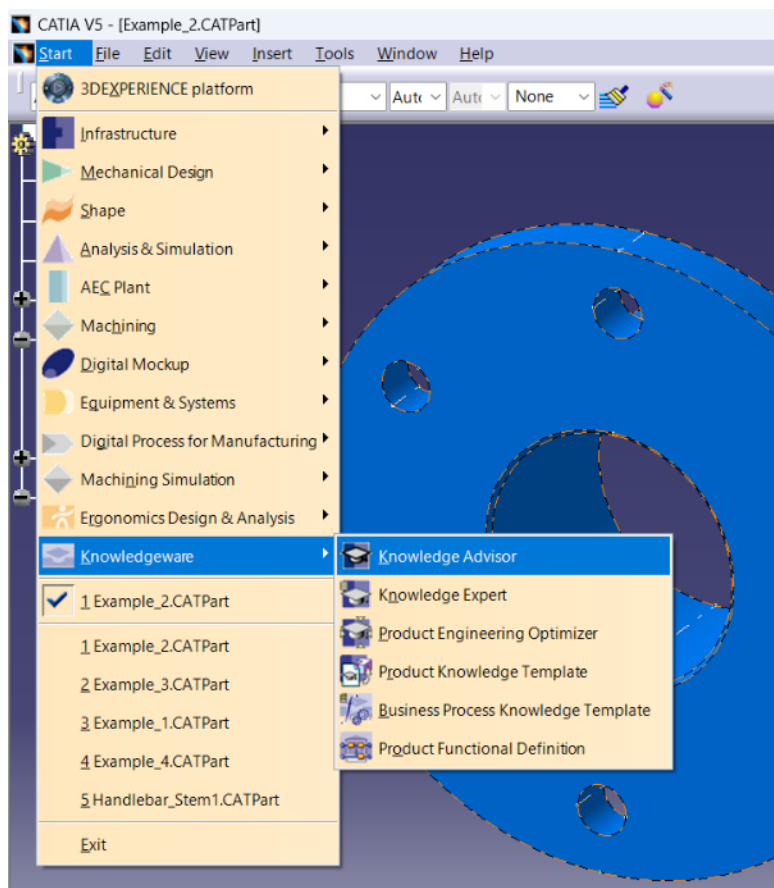

Adding conditional statements to a 3D Model

Using the Formula Editor the Relations are defined for all model dimensions and features

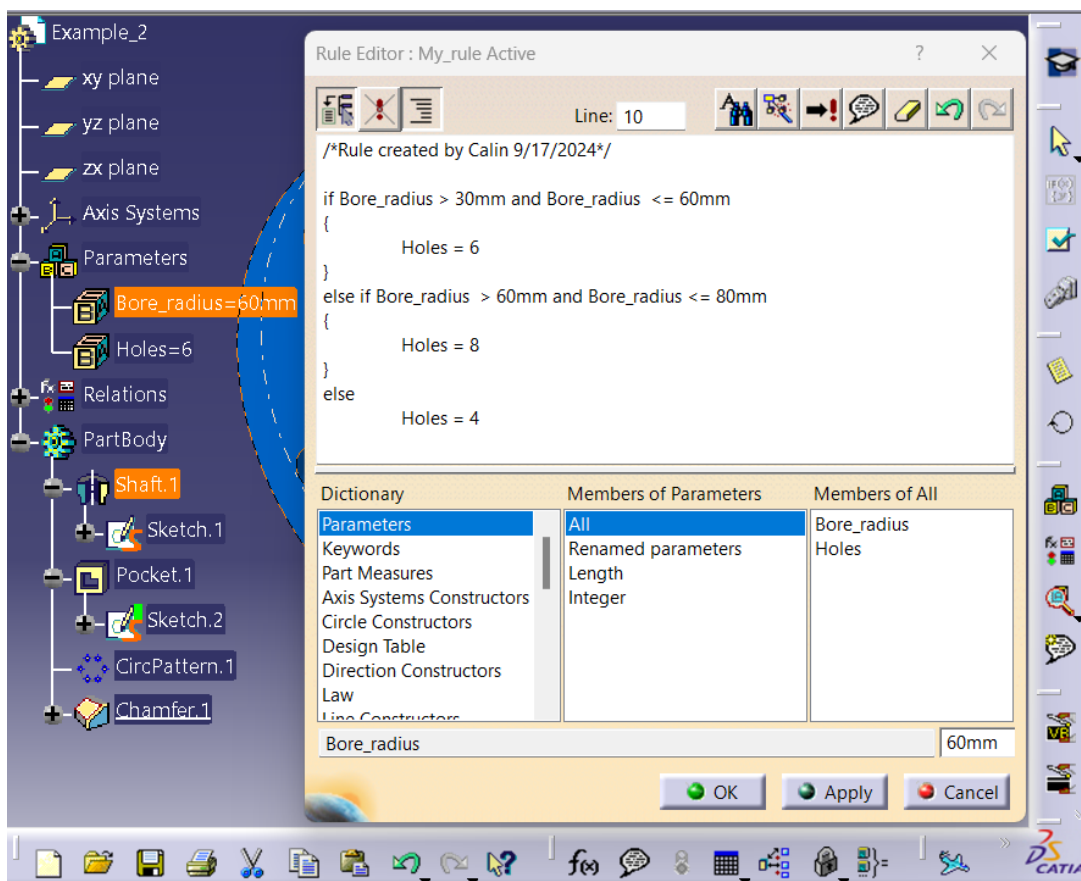

Adding conditional statements to a 3D Model

To implement our conditional statements, we must access **Knowledge Advisor** workbench and **Rule Editor**

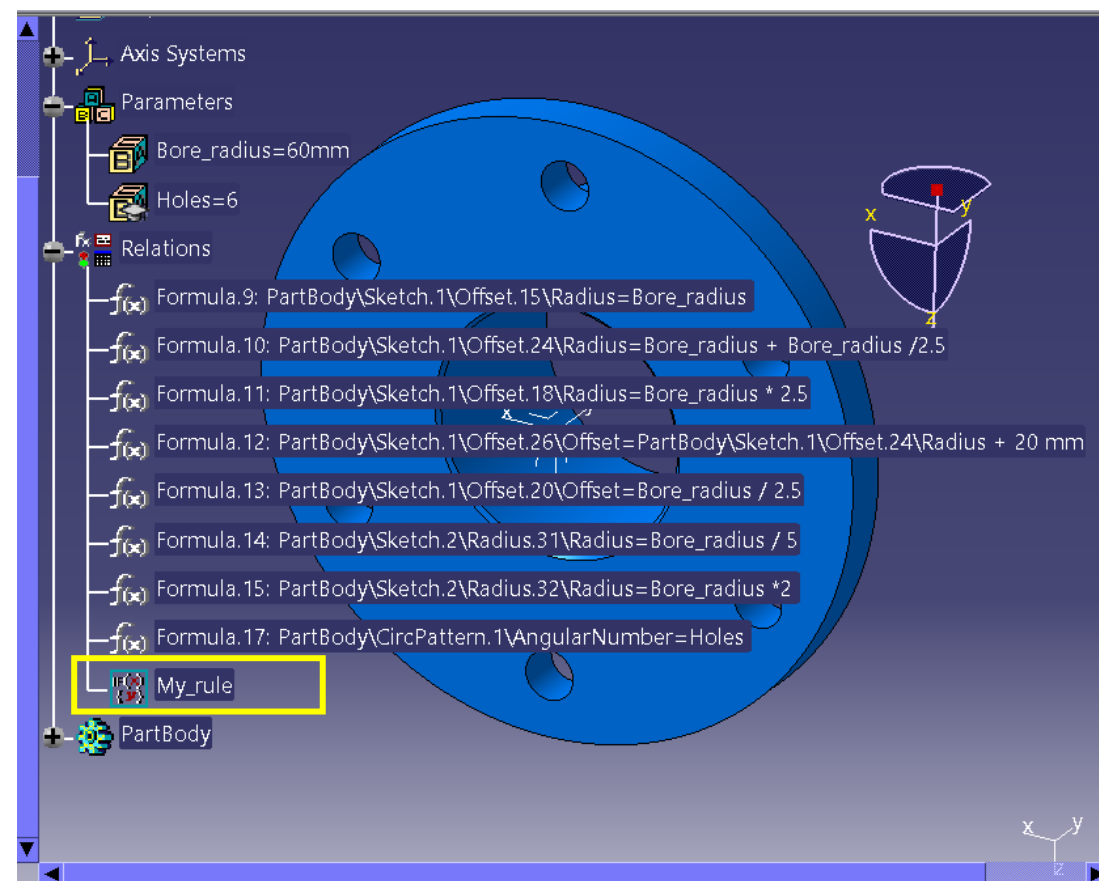

Adding conditional statements to a 3D Model

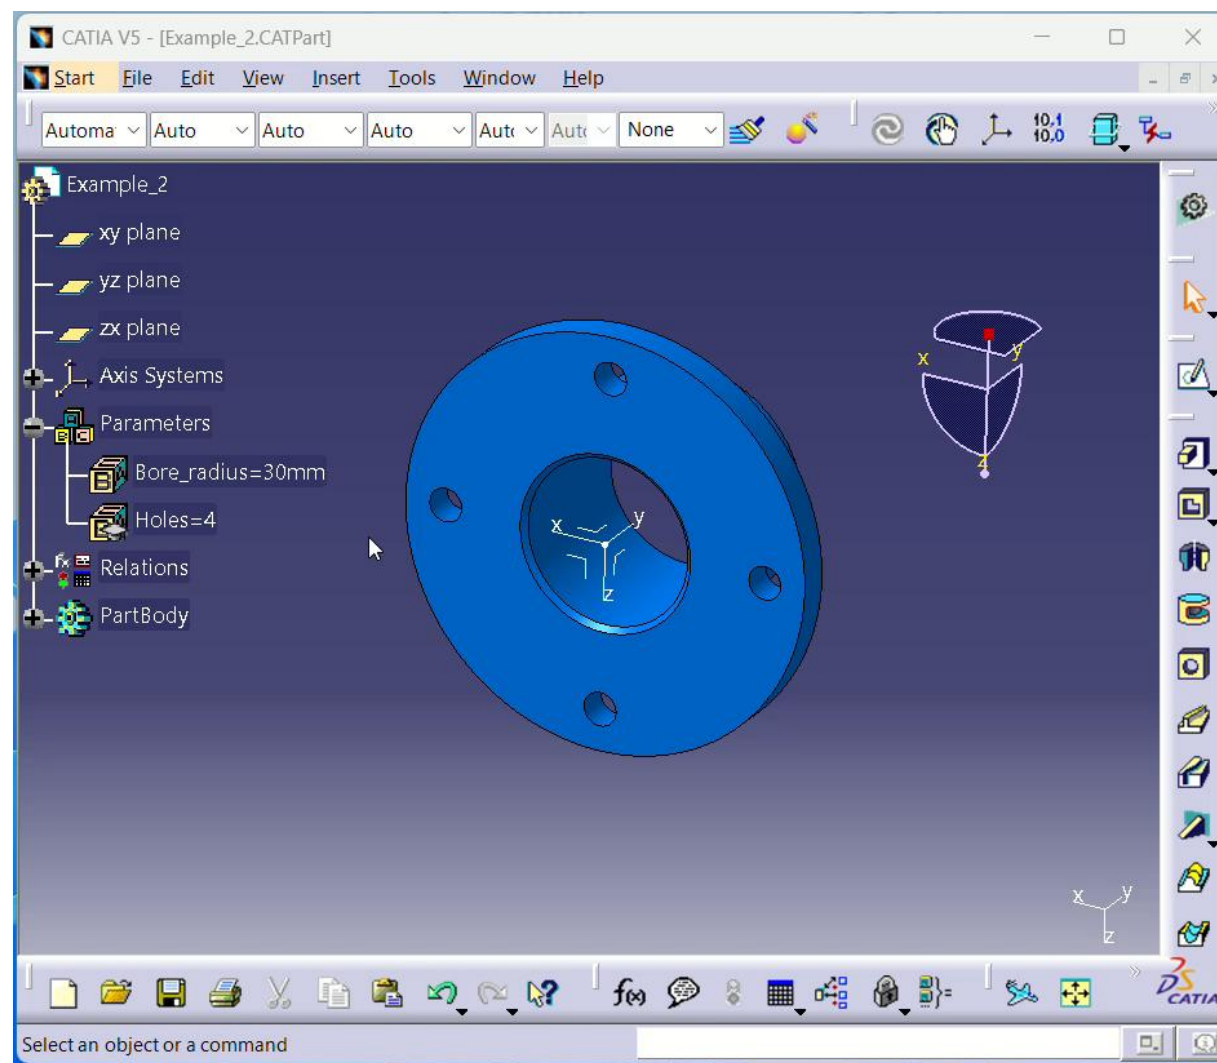

In the newly opened window, we can implement our rule

In the specification tree, the rule is displayed as a relation that can be activated or deactivated

Adding conditional statements to a 3D Model

Parametric design using Design Tables

Objective: Change the diameter of the holes (D) and the distance between them (A) depending on the part dimensions.

Rules:

$$D = W / 2$$

$$A = L / 4$$

Parameters [Length] : L

[Length] : W

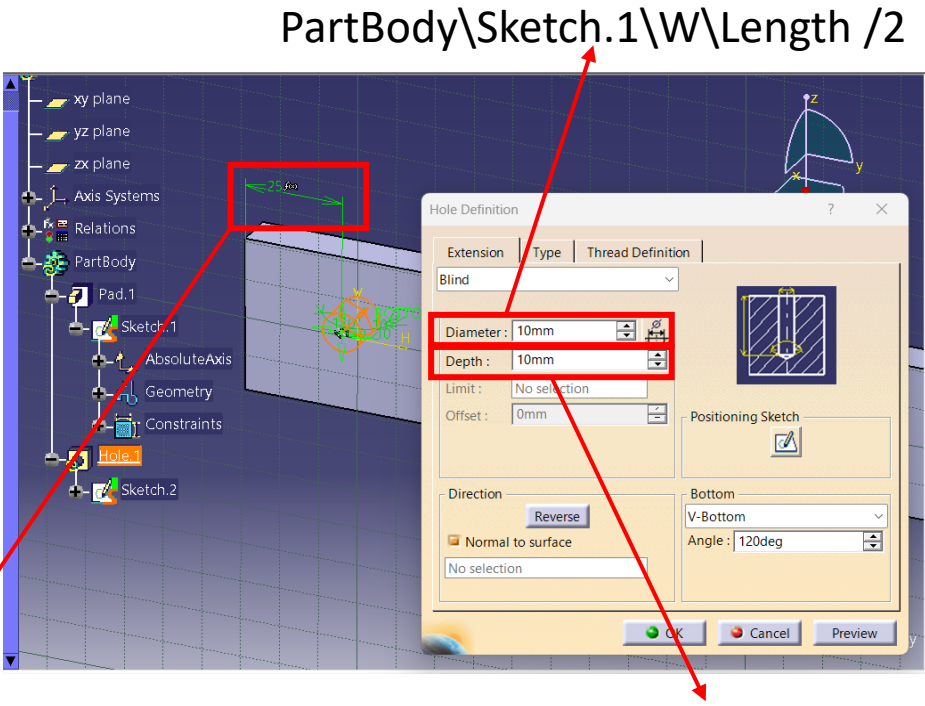

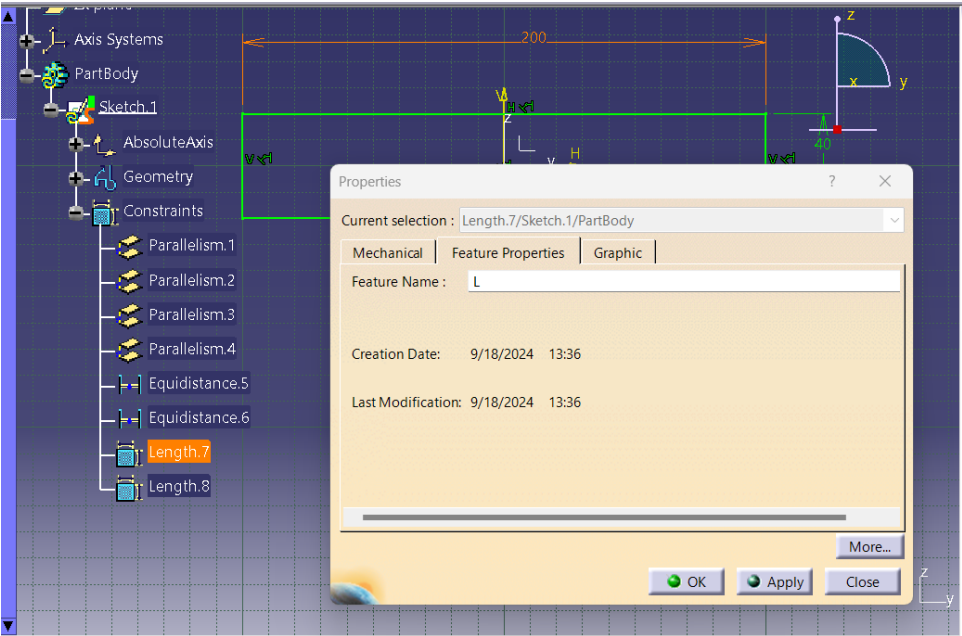

[Length] : B

Parametric design using Design Tables

Initially, the names used to describe the part's length and width are changed to **L** and **W**.

The relationships between the diameter, depth and the initial position of the hole, and the overall dimensions of the part are defined

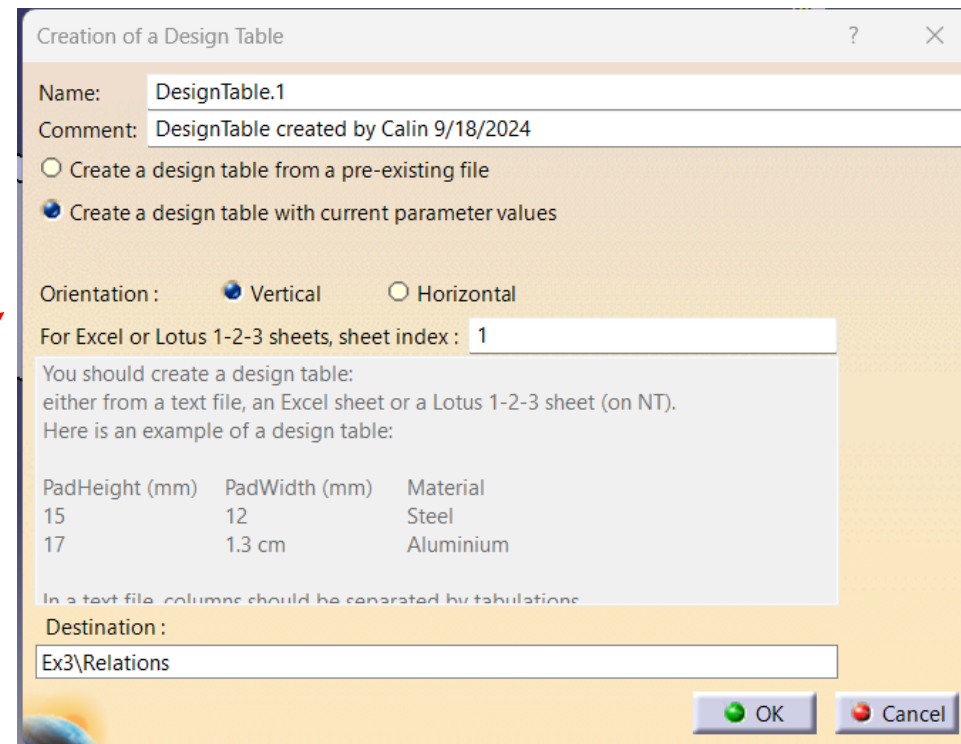

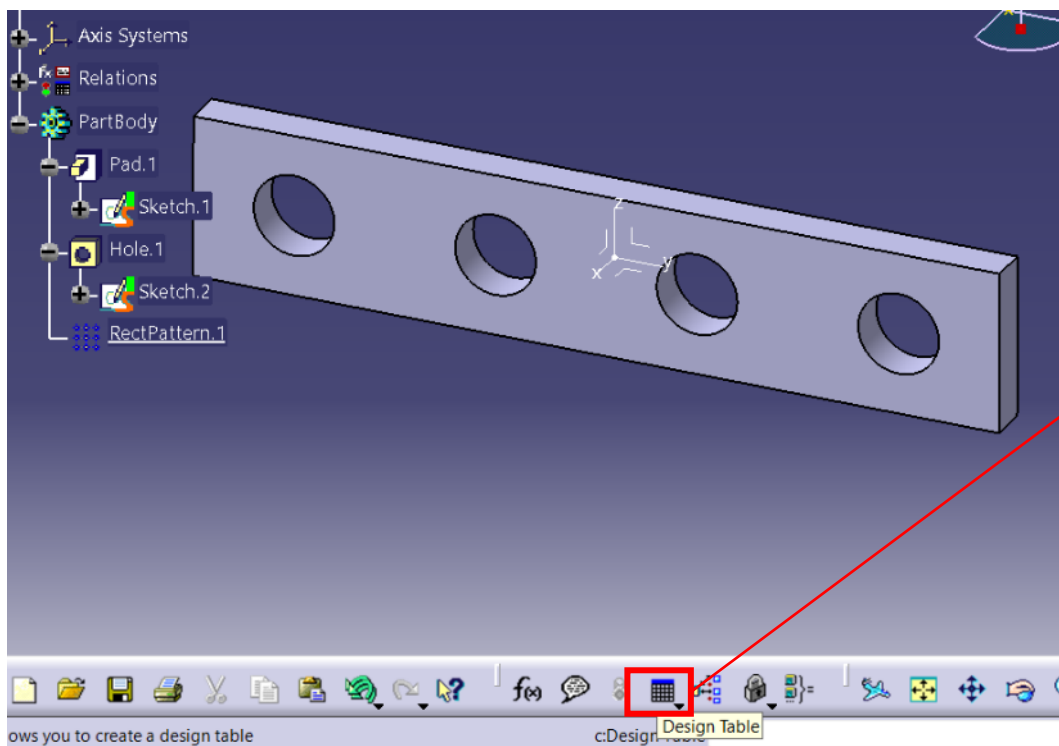

PartBody\Sketch.1\L\Length /8 PartBody\Pad.1\FirstLimit\Length

Parametric design using Design Tables

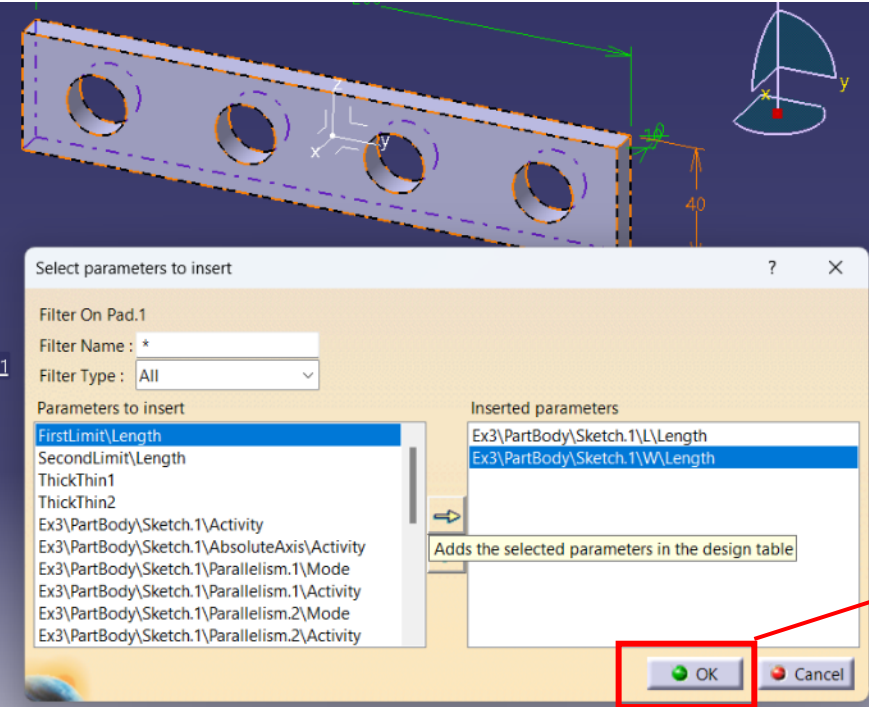

- Click the *Design Table* icon and the *Creation of a Design Table* window is displayed

In the newly opened window, we can enter a specific name for our Design Table and specify its orientation. Then click OK

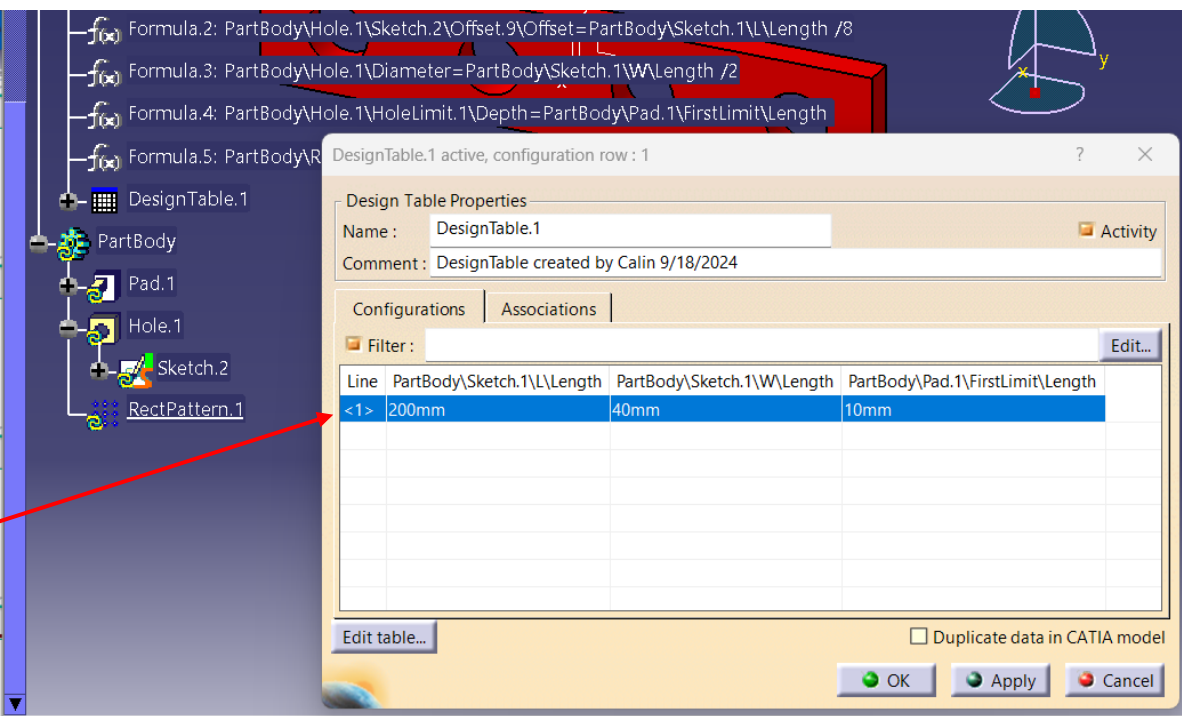

Parametric design using Design Tables

Next, we need to add parameters to our Design Table. After entering all the desired parameters, click OK

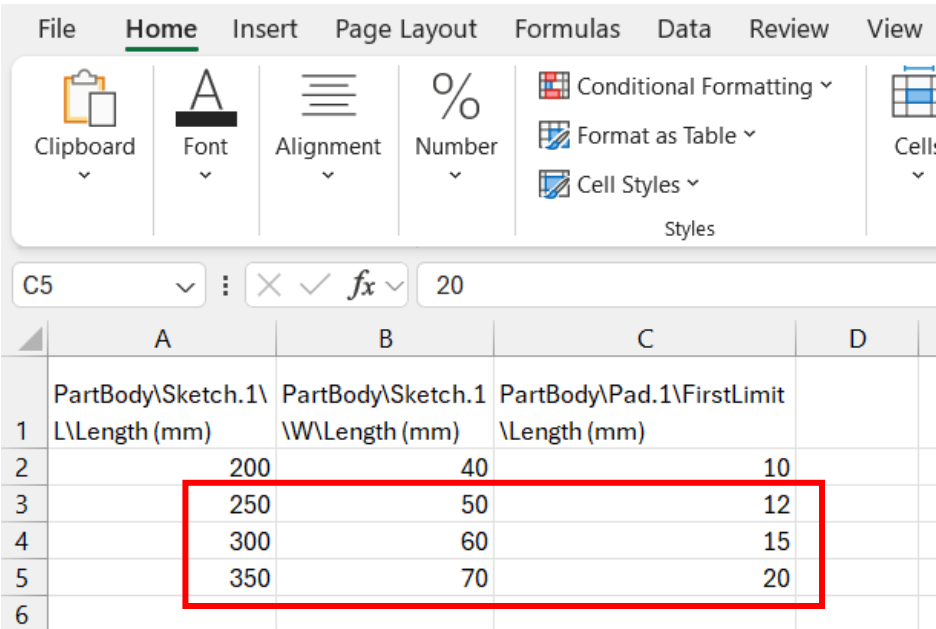

In the new window we find a preview of the Design Table currently with only one row.
If we want to add new rows (new part configurations) we have to click on Edit Table

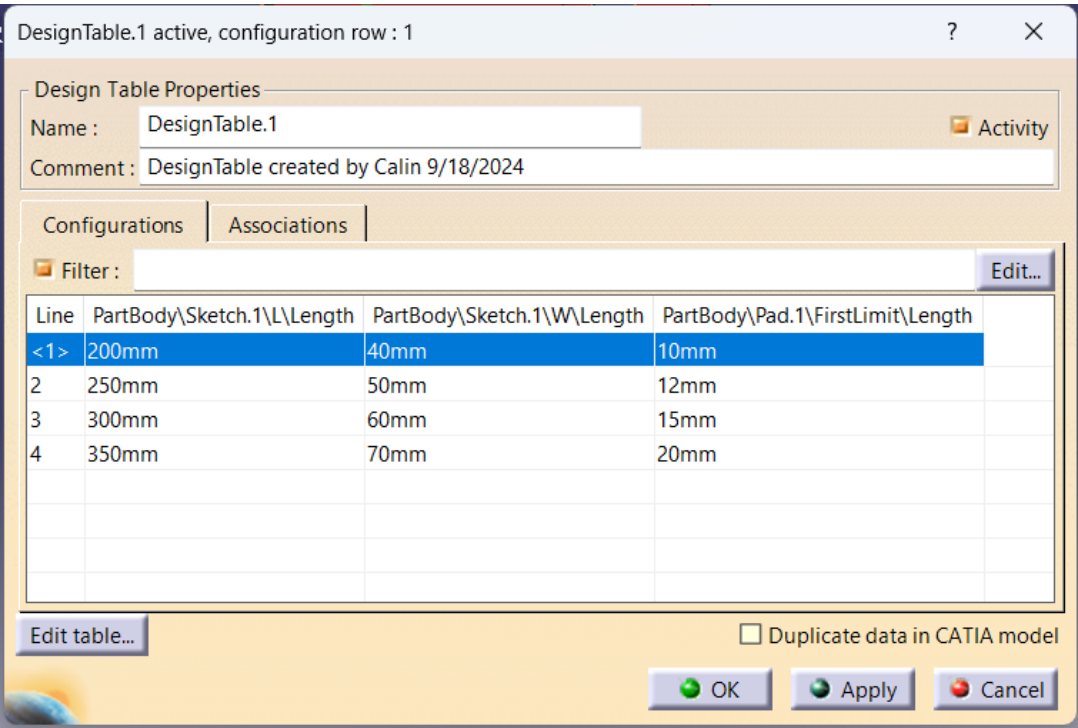

Parametric design using Design Tables

This time, our table will open in Excel, where we can edit and add the desired values.

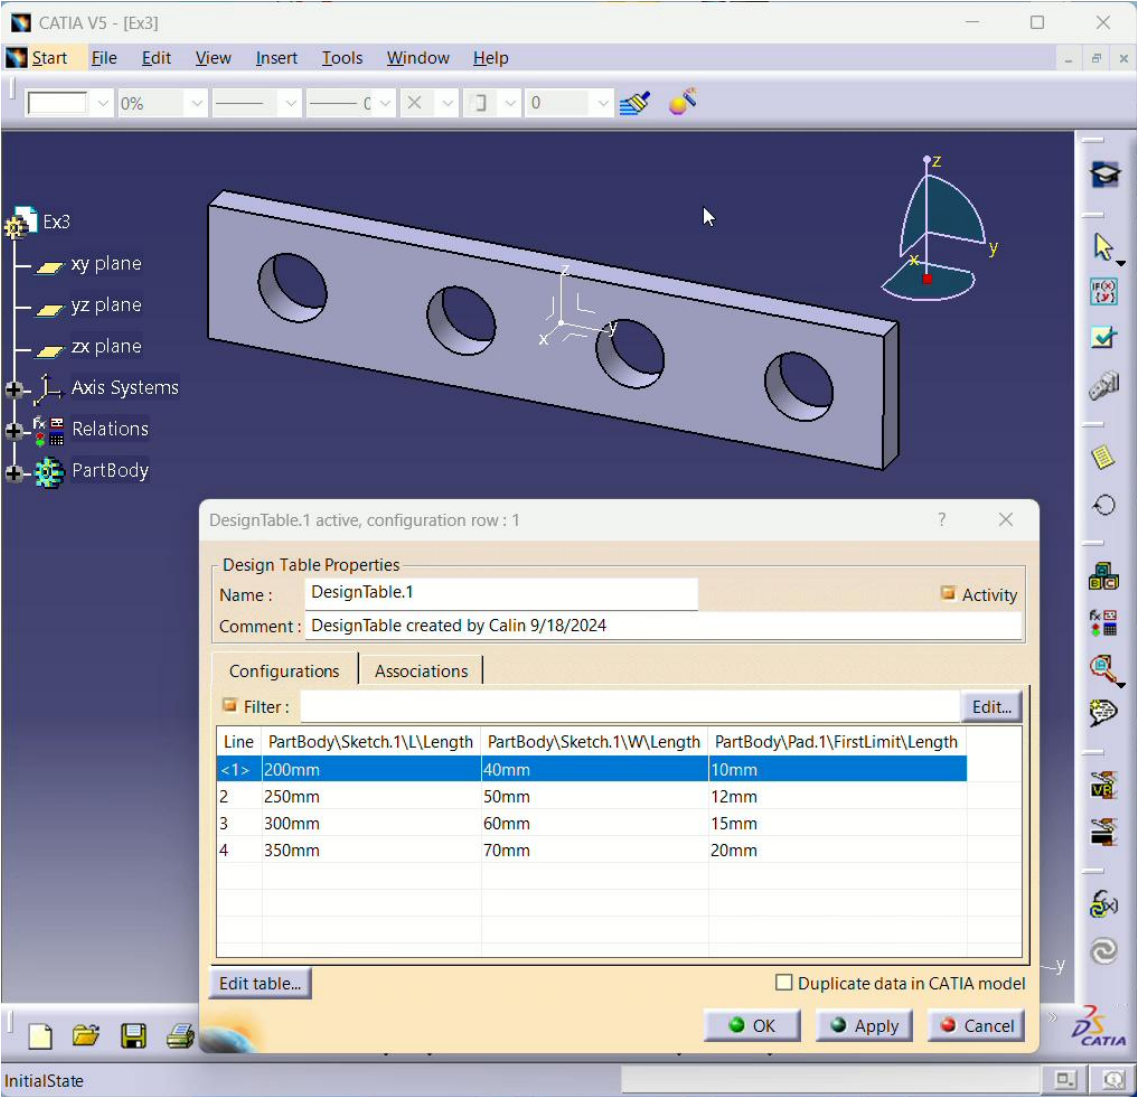

Line	PartBody\Sketch.1\L\Length (mm)	PartBody\Sketch.1\W\Length (mm)	PartBody\Pad.1\FirstLimit\Length (mm)
<1>	200mm	40mm	10mm
2	250mm	50mm	12mm
3	300mm	60mm	15mm
4	350mm	70mm	20mm

After saving the table in Excel, it will be automatically updated in CATIA

Line	PartBody\Sketch.1\L\Length	PartBody\Sketch.1\W\Length	PartBody\Pad.1\FirstLimit\Length
<1>	200mm	40mm	10mm
2	250mm	50mm	12mm
3	300mm	60mm	15mm
4	350mm	70mm	20mm

Parametric design using Design Tables

Case Study: Parametric Design of a Bike Handlebar Stem

Co-funded by
the European Union

Co-funded by
the European Union

Case Study: Parametric Design of a Bike Handlebar Stem

Objective: Parameterized design of a handlebar stem

Parameters [Length] : LENGTH

[Angle] : ANGLE

[Length] : THICKNESS

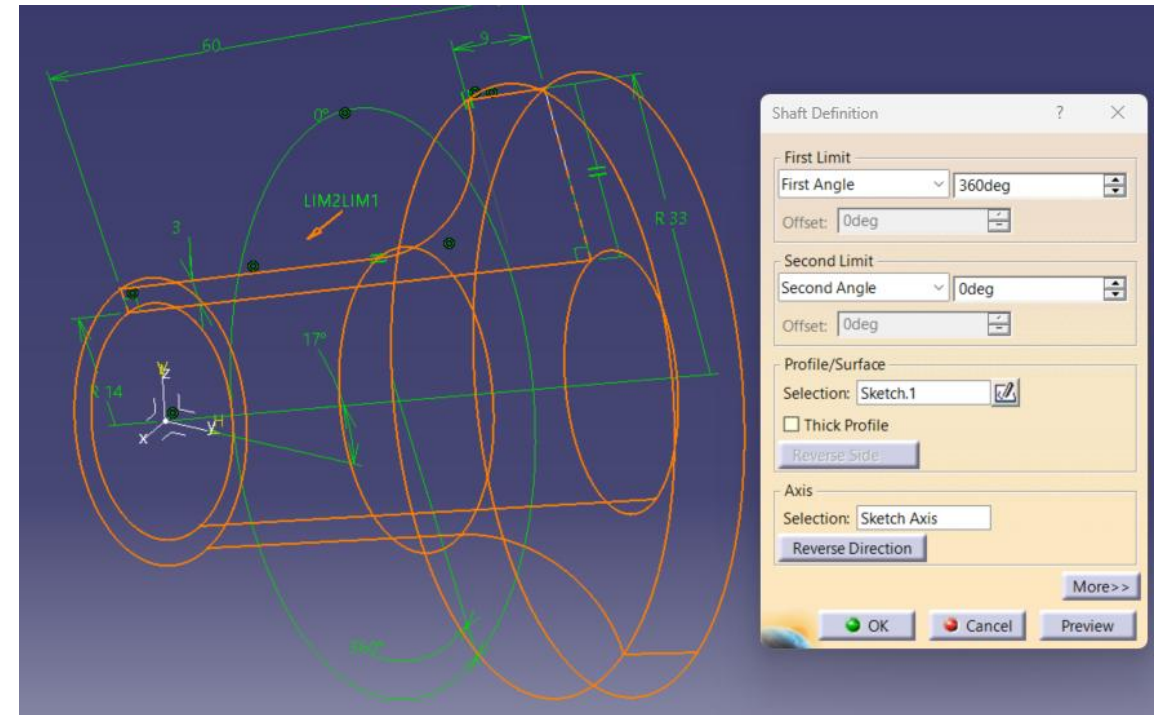

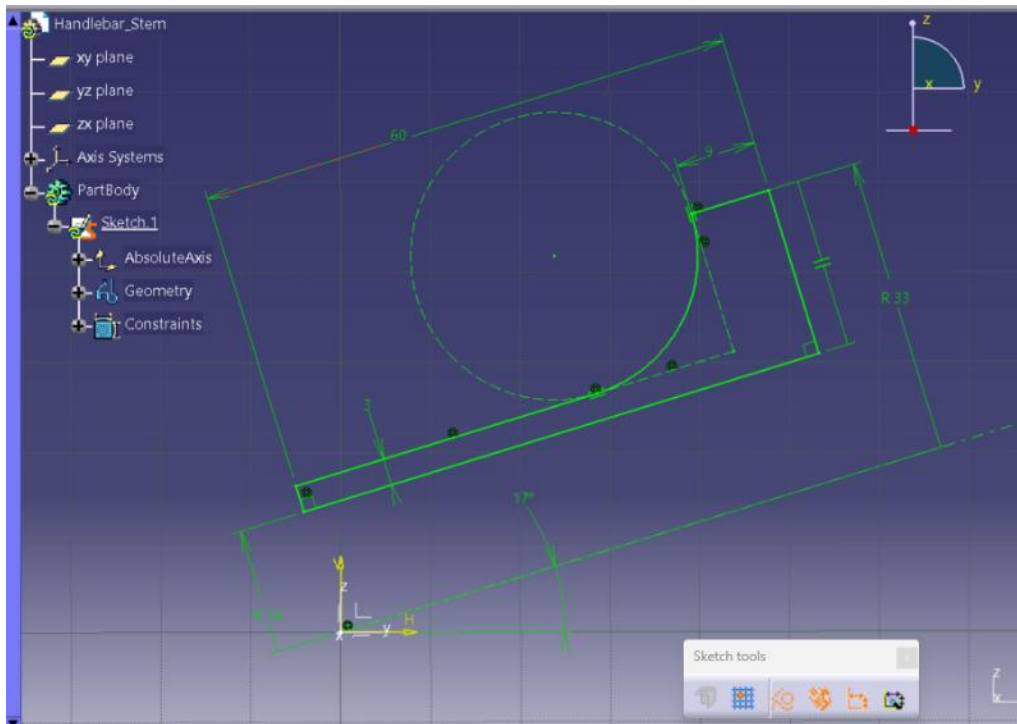

[Length] : HANDLEBAR_DIAM

[Length] : STEERER_TUBE

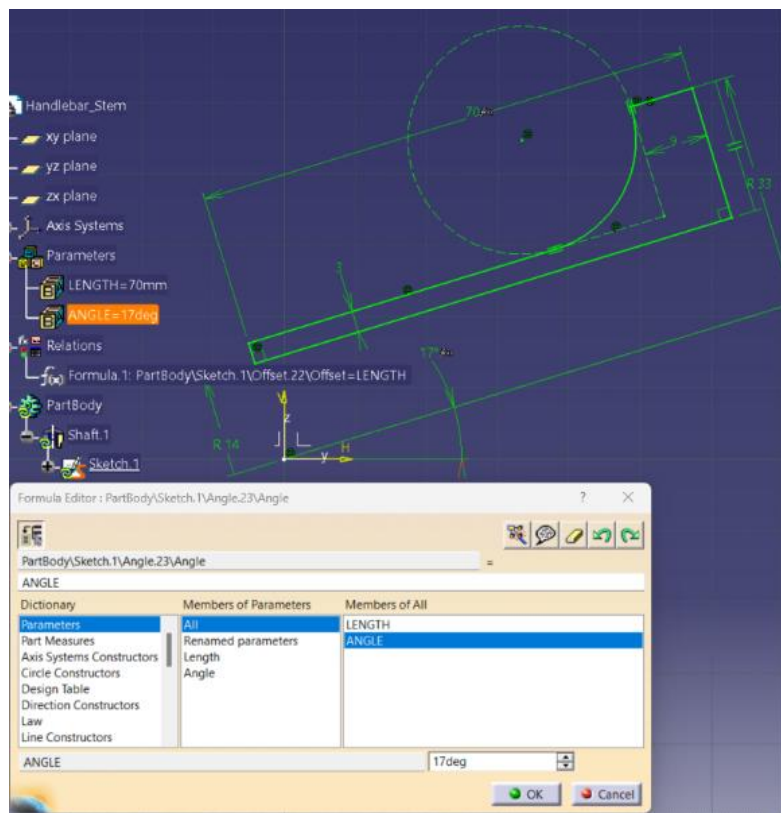

Case Study: Parametric Design of a Bike Handlebar Stem

- It starts from a fully defined sketch that contains an inclined symmetry axis.
- The tilt angle will become one of the parameters that will determine the geometry of the piece.
- Using the **Shaft** command, we can generate the main body shape for the handlebar stem

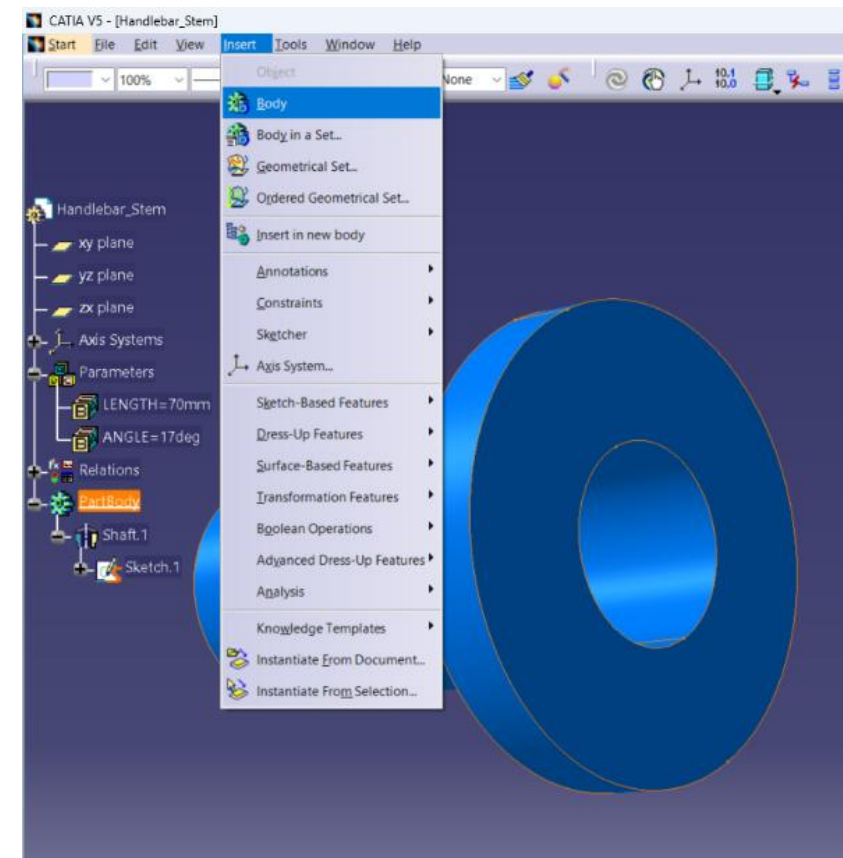

Case Study: Parametric Design of a Bike Handlebar Stem

We create the first two parameters (LENGTH and ANGLE) and link them to the corresponding dimensions in the sketch

To create the clamp for the steerer tube we need to insert a new **Body** in our part

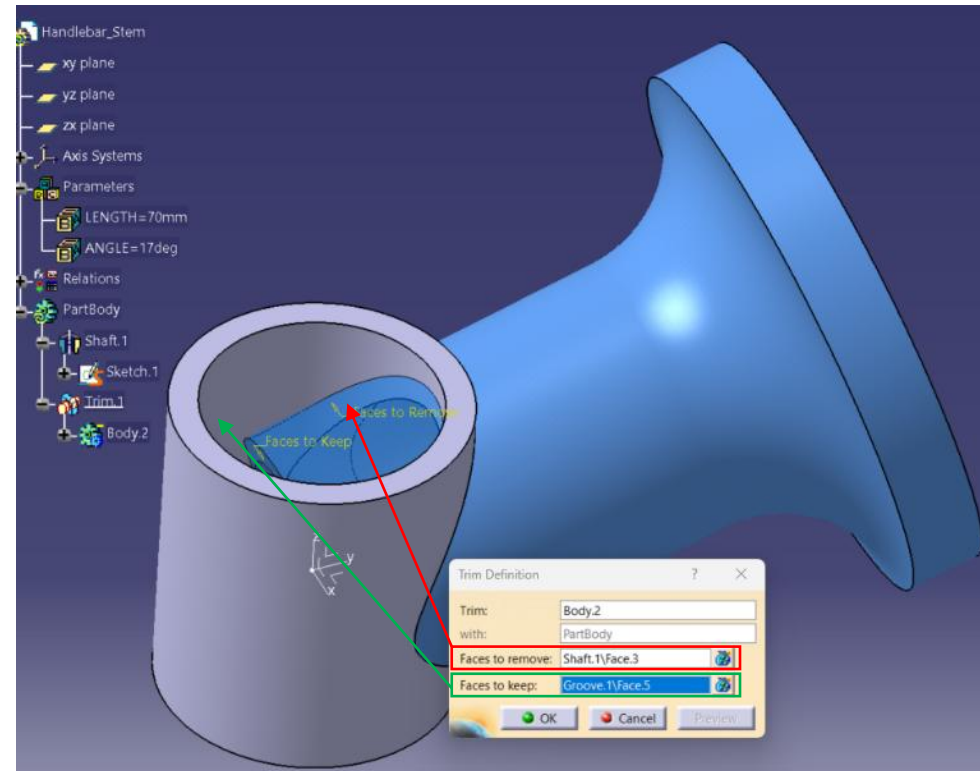

Case Study: Parametric Design of a Bike Handlebar Stem

- We draw here a new sketch, which will form the basis for the cylindrical part of the clamp.
- It is important to position the sketch a few mm above the cylindrical part of the main body.
- This distance will remain the same regardless of the angle of inclination of the main body in relation to the clamp

Case Study: Parametric Design of a Bike Handlebar Stem

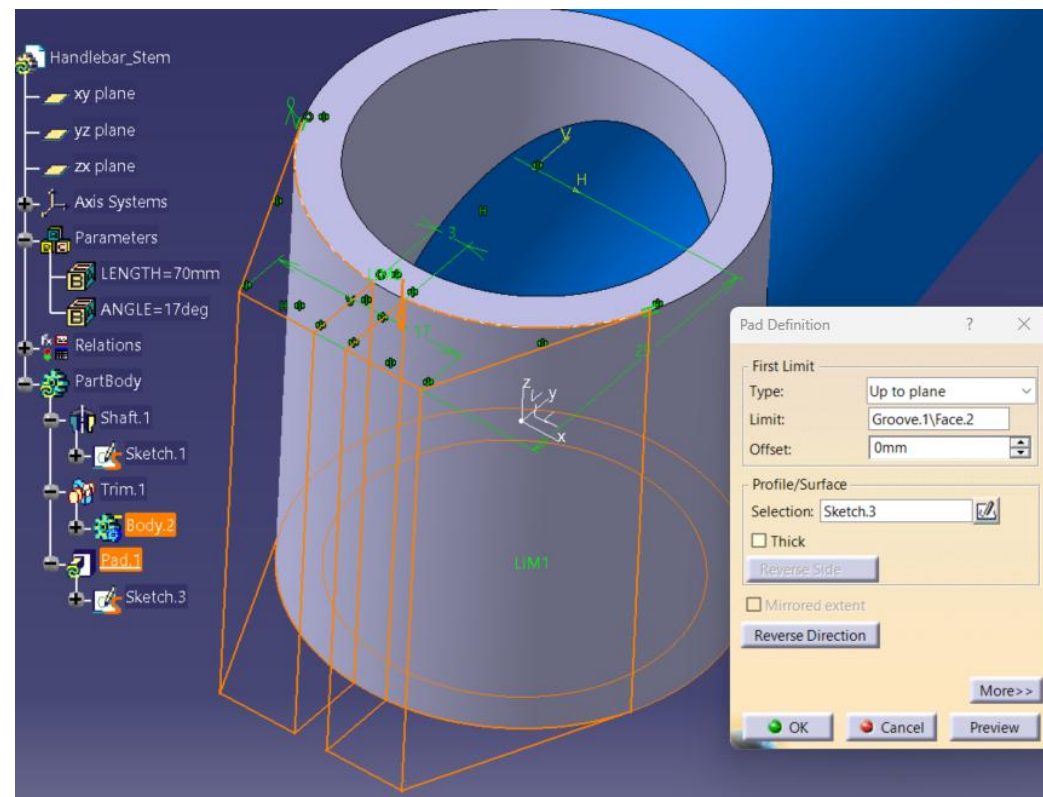

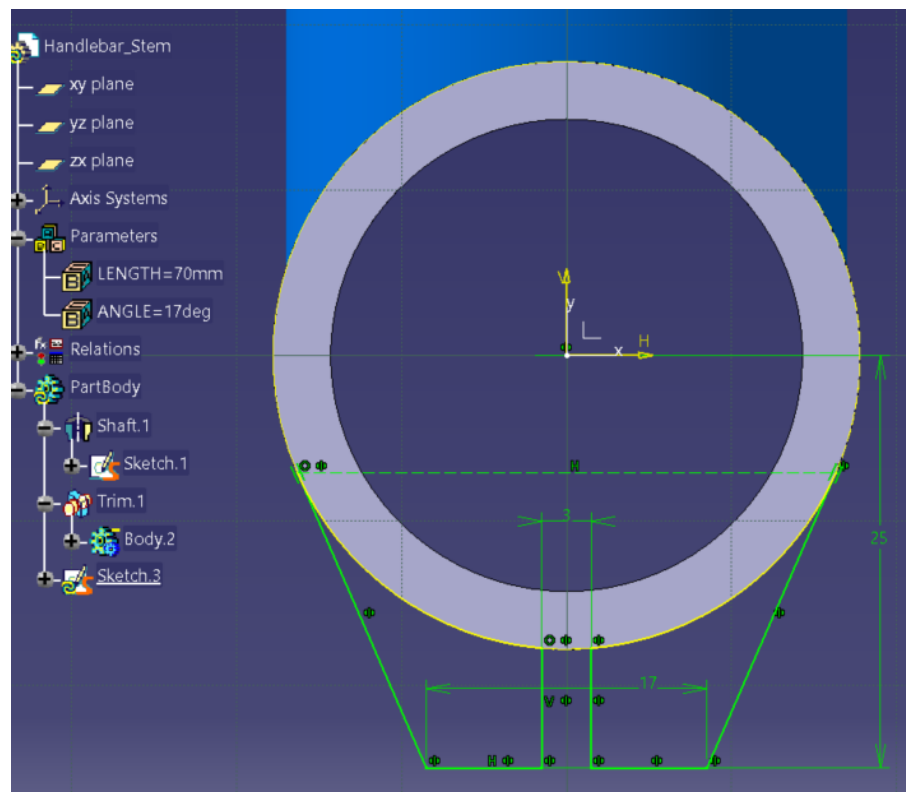

- Now we have to remove the part of the main body that is inside the clamp bore
- This can be done with the ***Union Trim*** command

Case Study: Parametric Design of a Bike Handlebar Stem

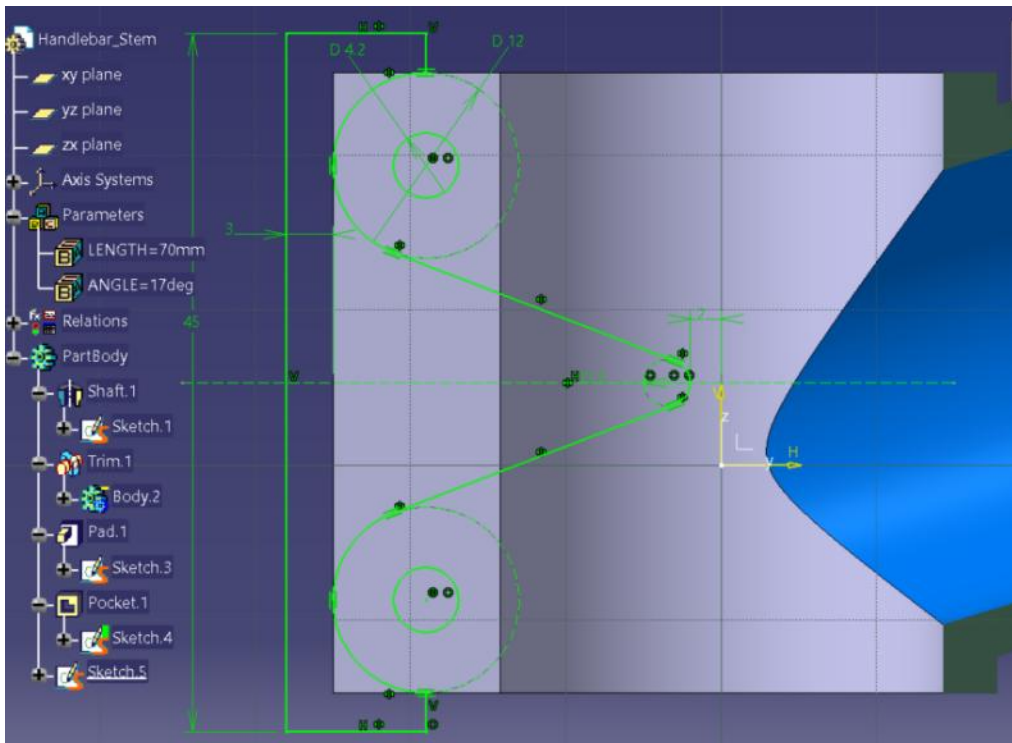

Now we can add the side parts that will contain the holes for the clamp tightening screws

When using the **Pad** command, it is recommended that you use one of the options "*Up to plane*" or "*Up to next*"

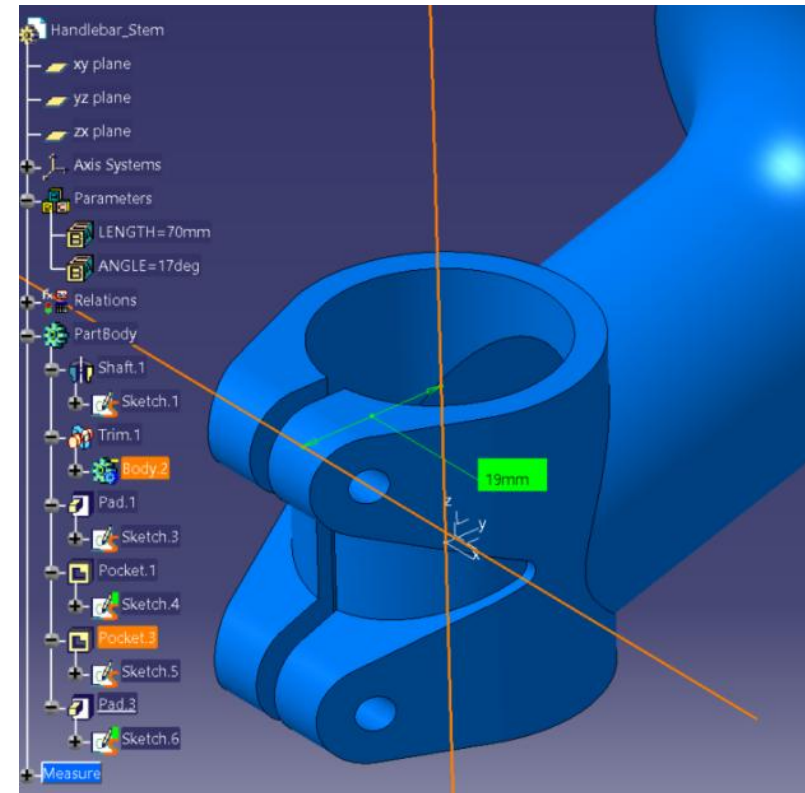

Case Study: Parametric Design of a Bike Handlebar Stem

We continue the construction of the clamp shape and add the holes for the tightening screws

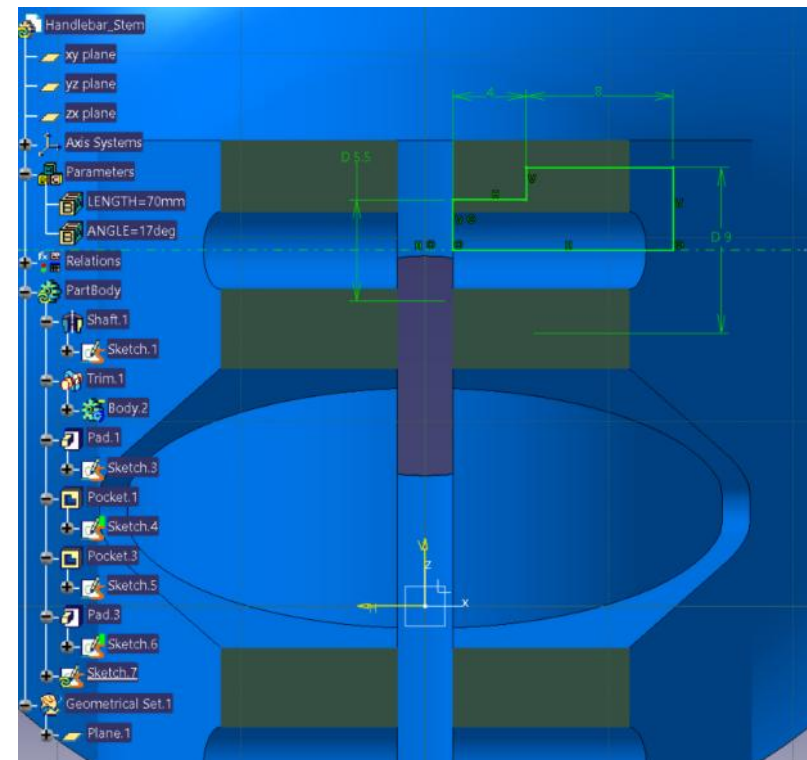

Case Study: Parametric Design of a Bike Handlebar Stem

- Now we restore the lateral side of the bore, partially removed in the previous operation
- It is necessary to measure the distance from the axis of the screw holes to the axis of the clamp

Case Study: Parametric Design of a Bike Handlebar Stem

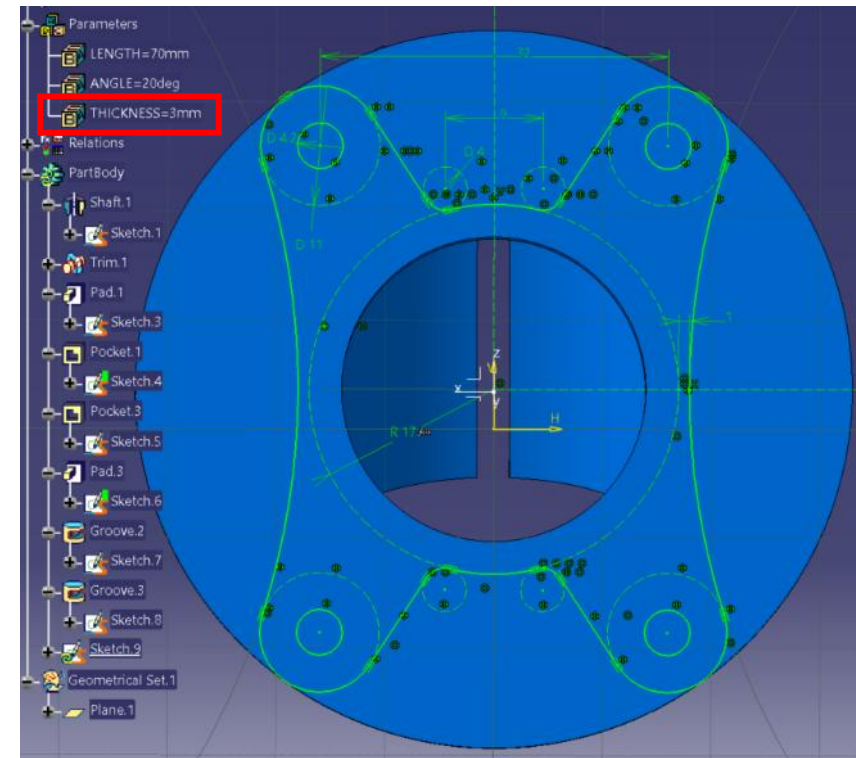

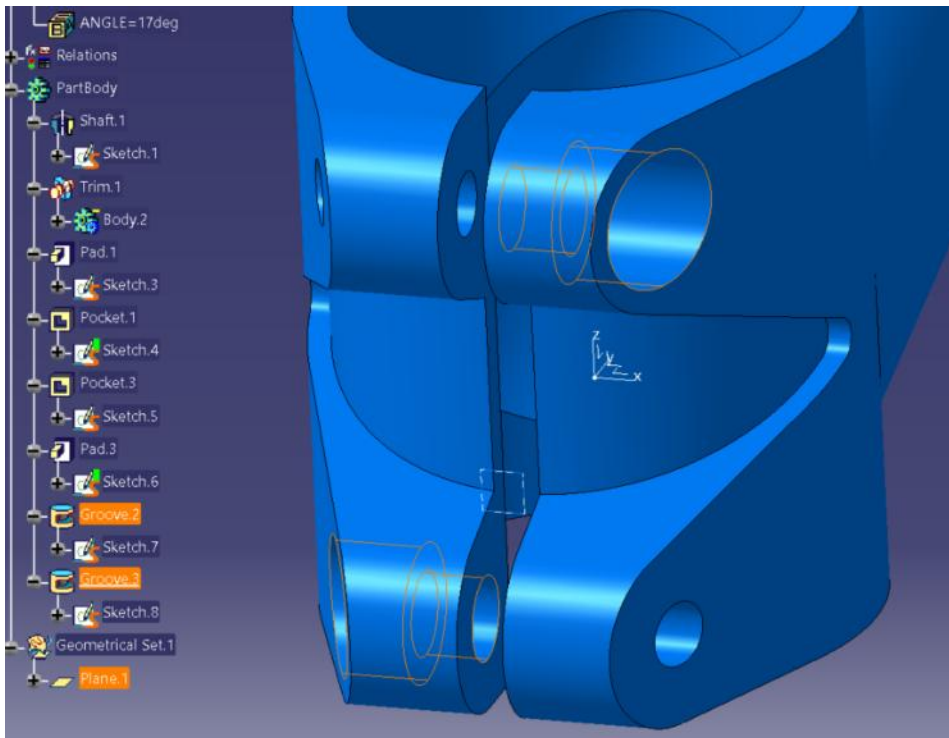

- We will create a plane at the previously determined distance
- On this plan we will draw the cross section of two counterbored holes
- These will be the through holes for the clamp set screws

Case Study: Parametric Design of a Bike Handlebar Stem

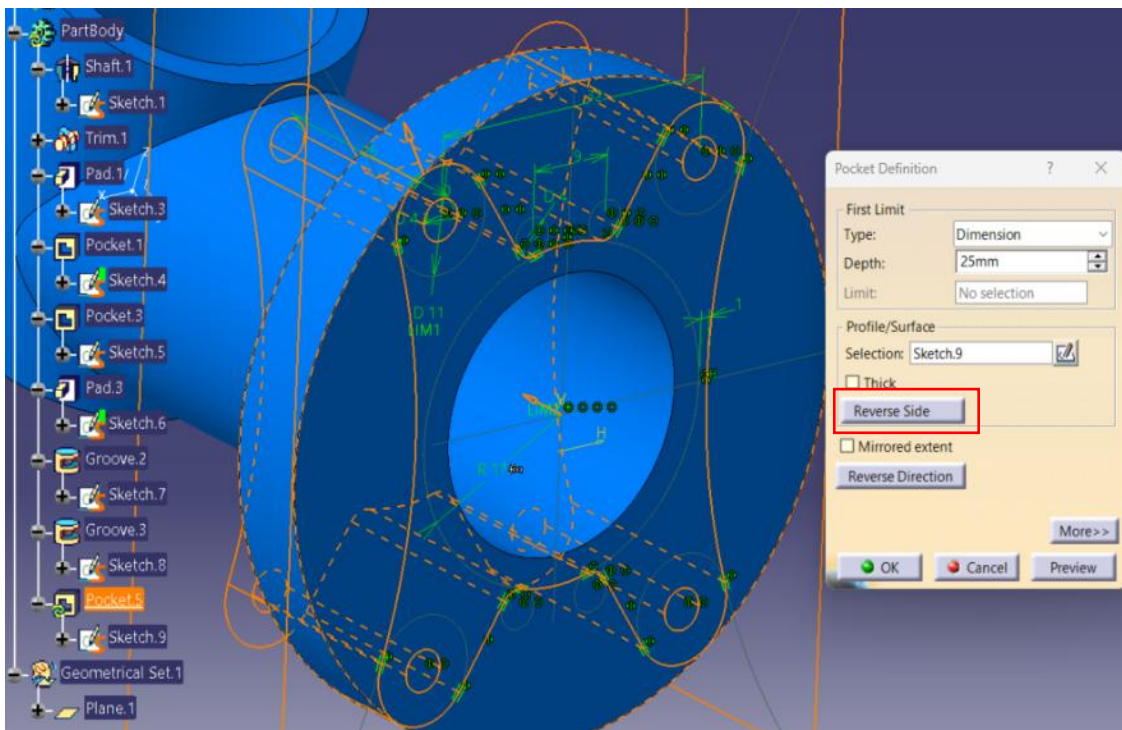

Based on the previous sketches, we can obtain the two holes using the **Groove** command

- Next, we deal with the handlebar fixing clamp
- Here we have to add another parameter to modify this part of the stem depending on the handlebar diameter

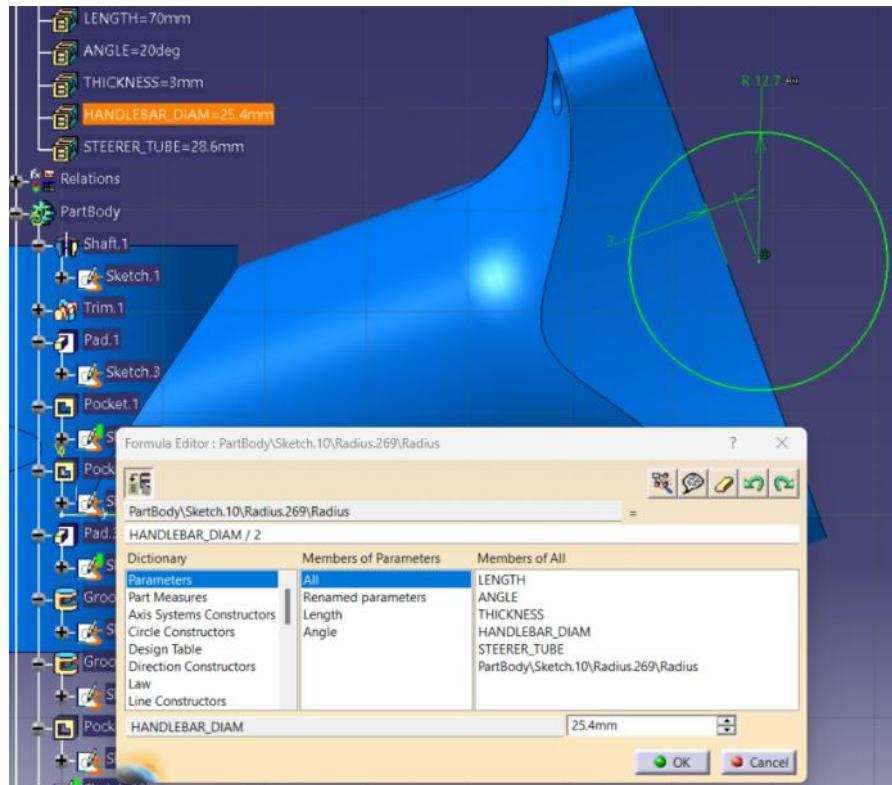

Case Study: Parametric Design of a Bike Handlebar Stem

- Using the previously created sketch we can obtain the basic shape of the handlebar clamp using the **Pocket** command with **Reverse Side** option

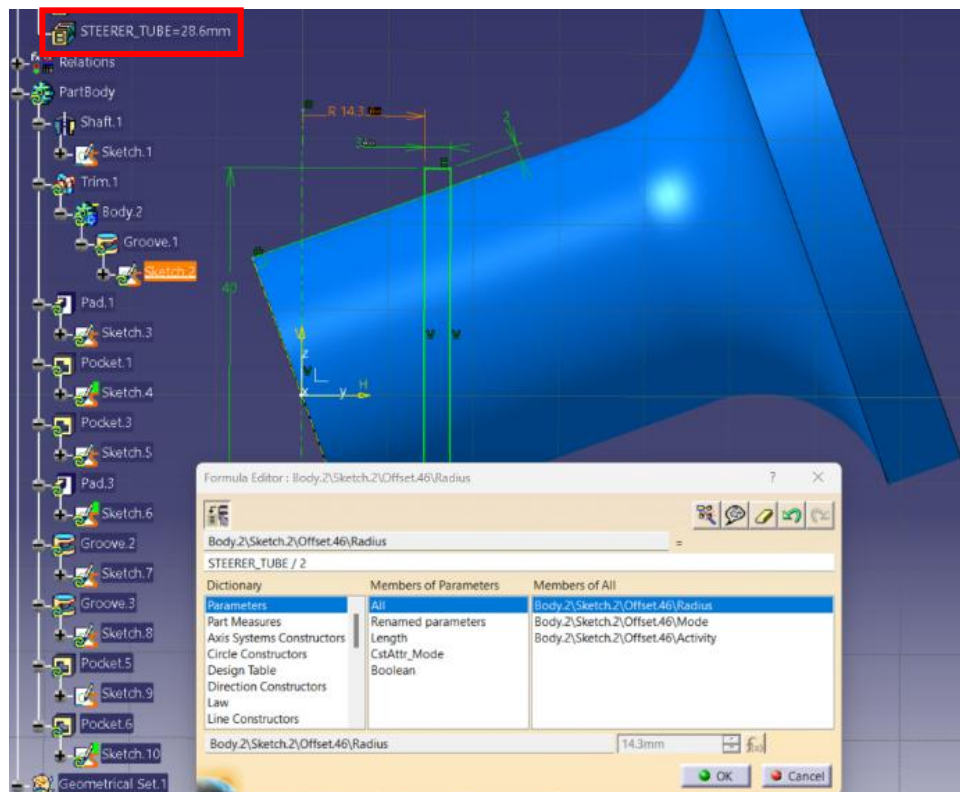

Case Study: Parametric Design of a Bike Handlebar Stem

At the end we draw a circle in a median plane. Its radius will be equal to half of the **HANDLEBAR_DIAM** parameter value

Case Study: Parametric Design of a Bike Handlebar Stem

We define another parameter, to be able to change the shape of the stem for different diameters of the steerer tube.

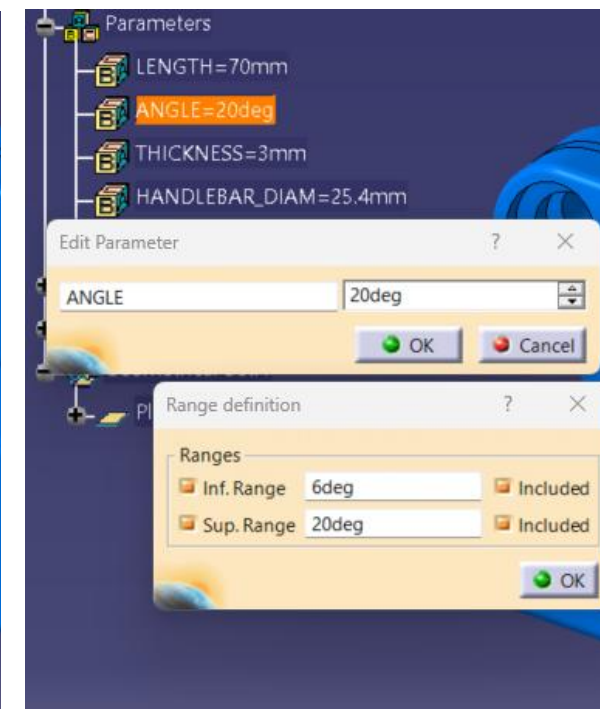

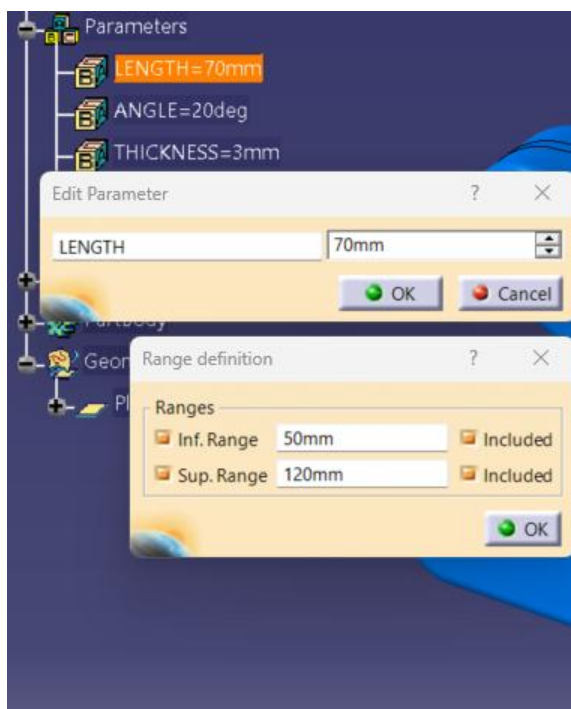

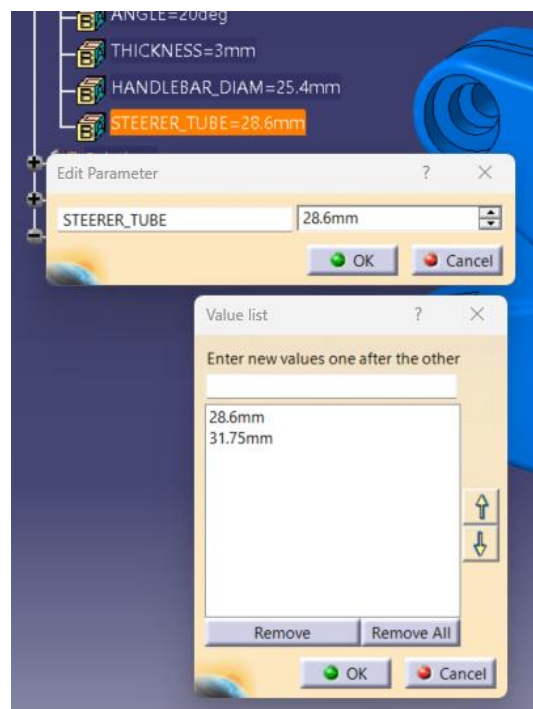

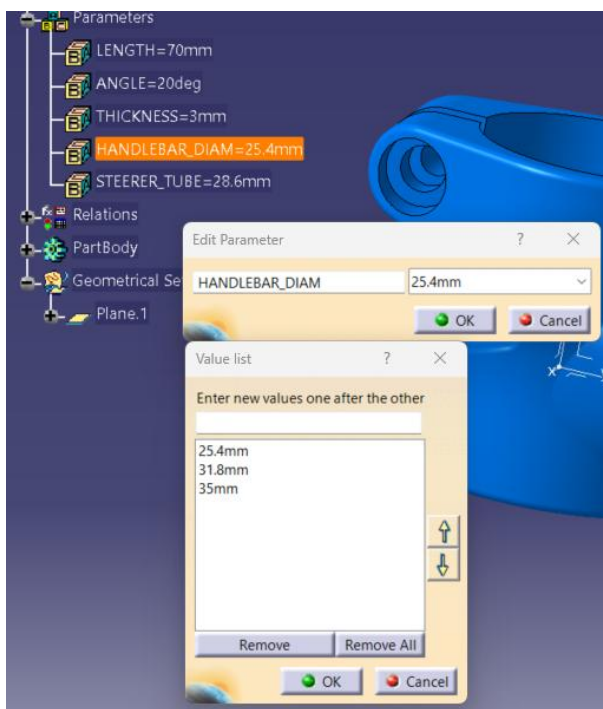

Finally, we round the outer edges of the part with a radius of 1 mm

Case Study: Parametric Design of a Bike Handlebar Stem

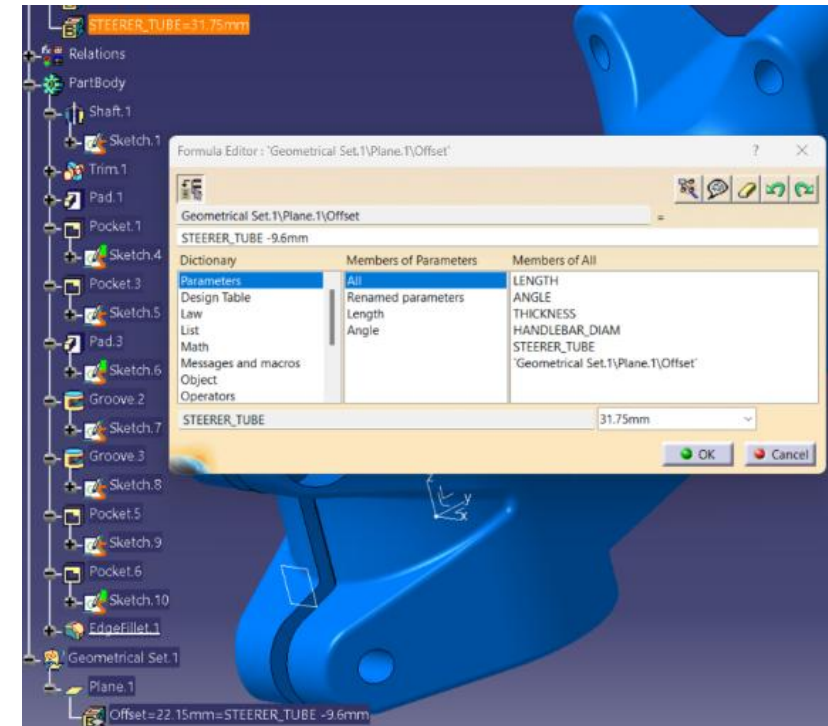

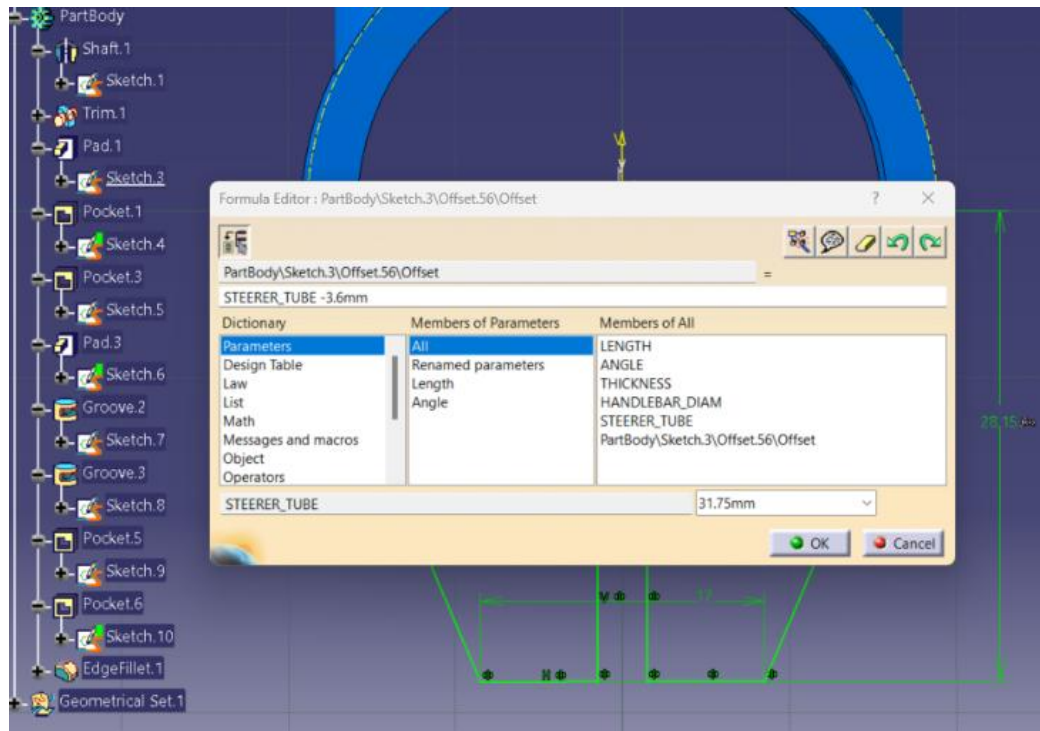

The usual values for the handlebar and steerer tube diameters are defined, as well as the limits of the values for the tilt angle and the total length.

Case Study: Parametric Design of a Bike Handlebar Stem

To be sure that the stem keeps its shape, we need to additionally edit the relations for:

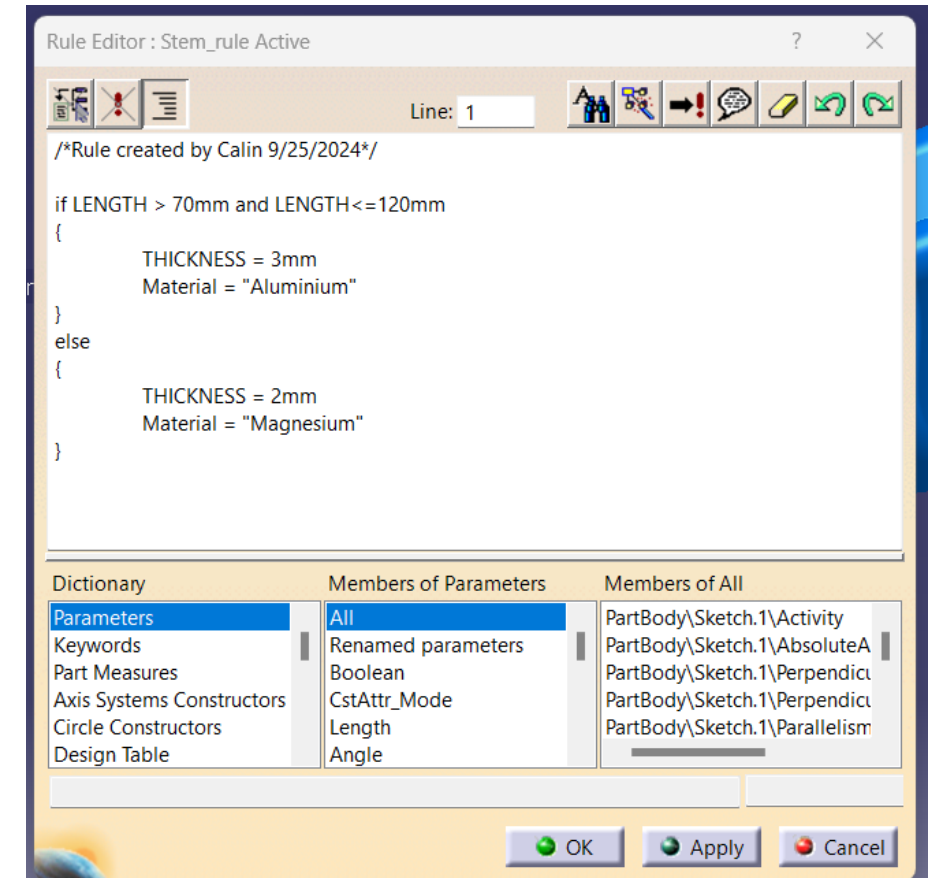

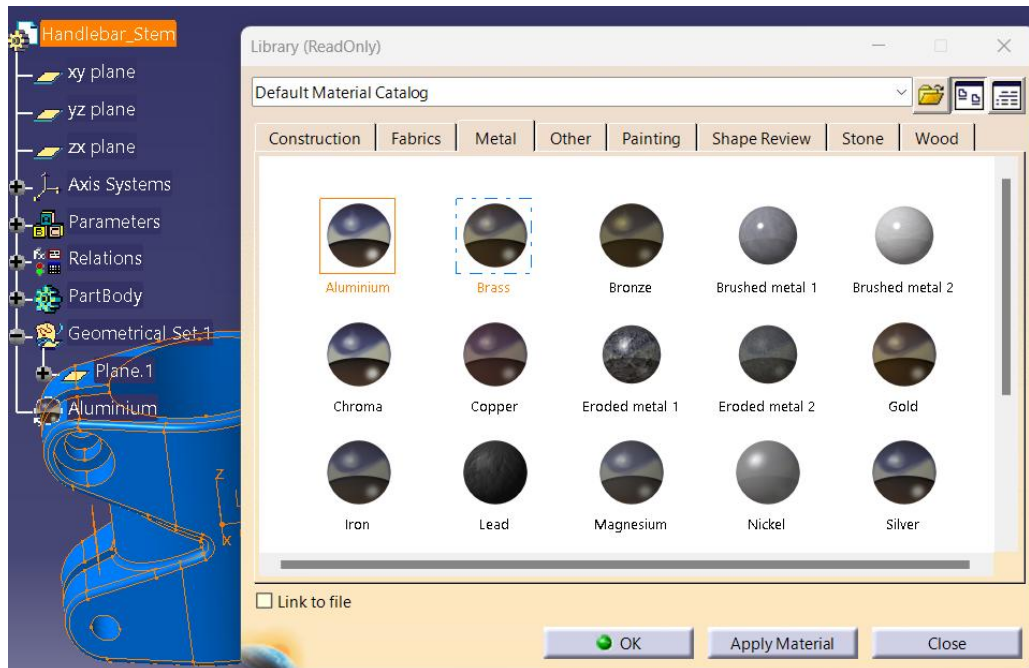

- length of the side parts that will contain the holes
- the position of the median plane for the through holes

Case Study: Parametric Design of a Bike Handlebar Stem

- Now we can define the stem material, for example Aluminum
- We establish the following rule:

If the total length is between 70 and 120 mm, then Aluminum is used as material, and the wall thickness is 3 mm. Otherwise, the material is Magnesium, and the thickness will be 2 mm

Case Study: Parametric Design of a Bike Handlebar Stem

Knowledge-Based Engineering (KBE) in CATIA

Co-funded by
the European Union

Co-funded by
the European Union

Knowledge-Based Engineering (KBE) in CATIA

Knowledge-Based Engineering:

- is an engineering approach that captures and reuses product and process engineering knowledge to automate design tasks.
- combines object-oriented programming, artificial intelligence, and computer-aided design to create intelligent CAD models

How KBE captures and reuses engineering knowledge:

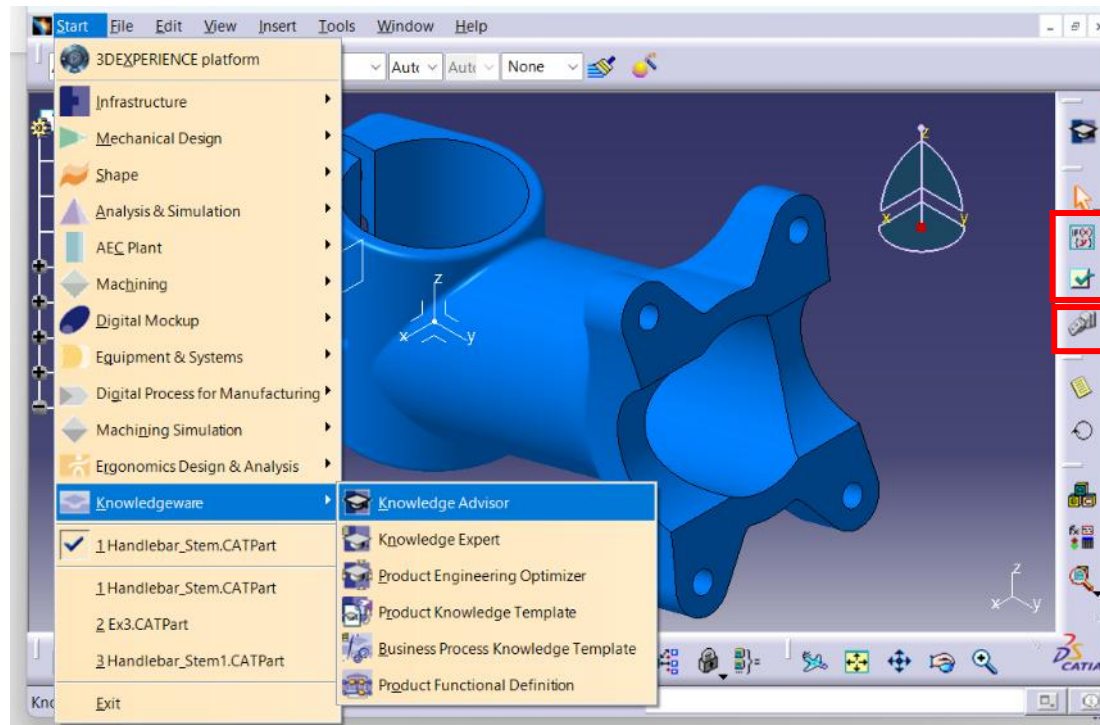

- Parametric modeling: Creating flexible, rule-driven geometric models
- Design rules and constraints: Encoding engineering best practices and limitations
- Knowledge patterns: Reusable templates for common design scenarios
- Automation scripts: Programs that execute complex design tasks based on inputs

CATIA's Knowledge Advisor

Overview of the tool:

- Designed for creating and managing rules and checks within a single design document
- Defines rules and checks to ensure compliance with design standards.
- Provide visual feedback on rule violation

Rules embedded in the design that reacts to parameter changes

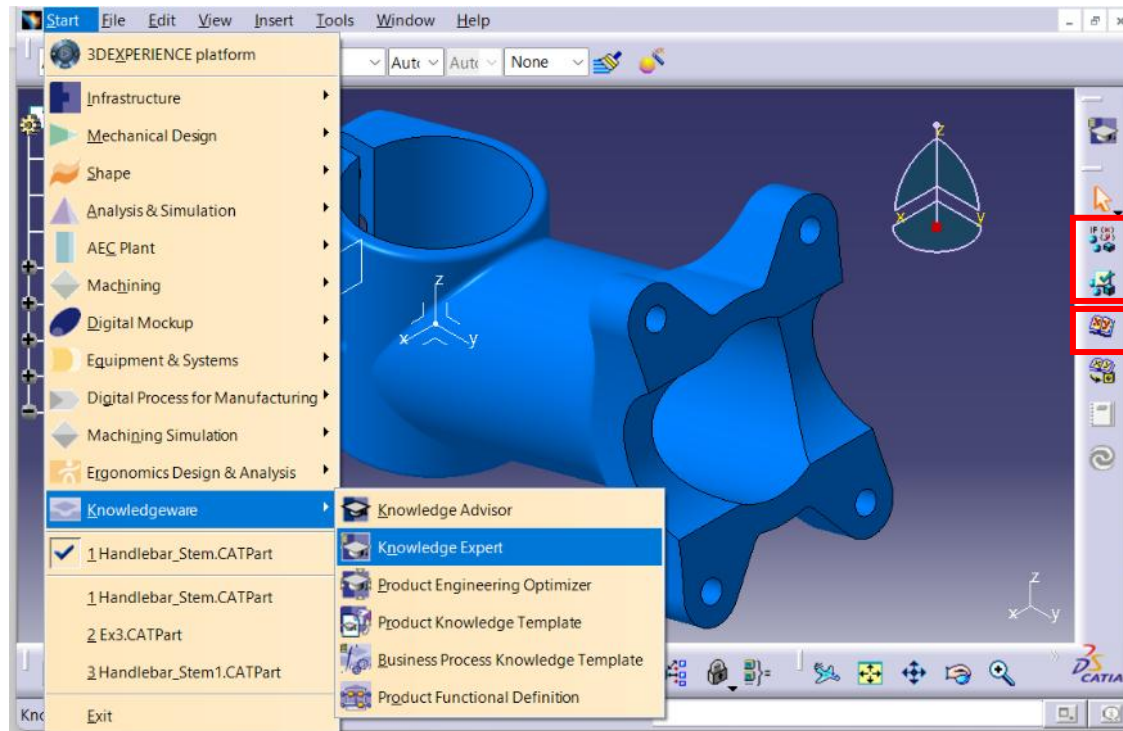

Check embedded in the design that inform the user in case of violation

Reaction feature that reacts to specific events and propagates any type of modifications

CATIA's Knowledge Expert

Overview of the tool:

- A more comprehensive tool for building and managing knowledge bases across multiple projects
- Create and manages generic rules and checks that can be applied to multiple design documents
- Allows for the creation of rule sets to structure the knowledge base

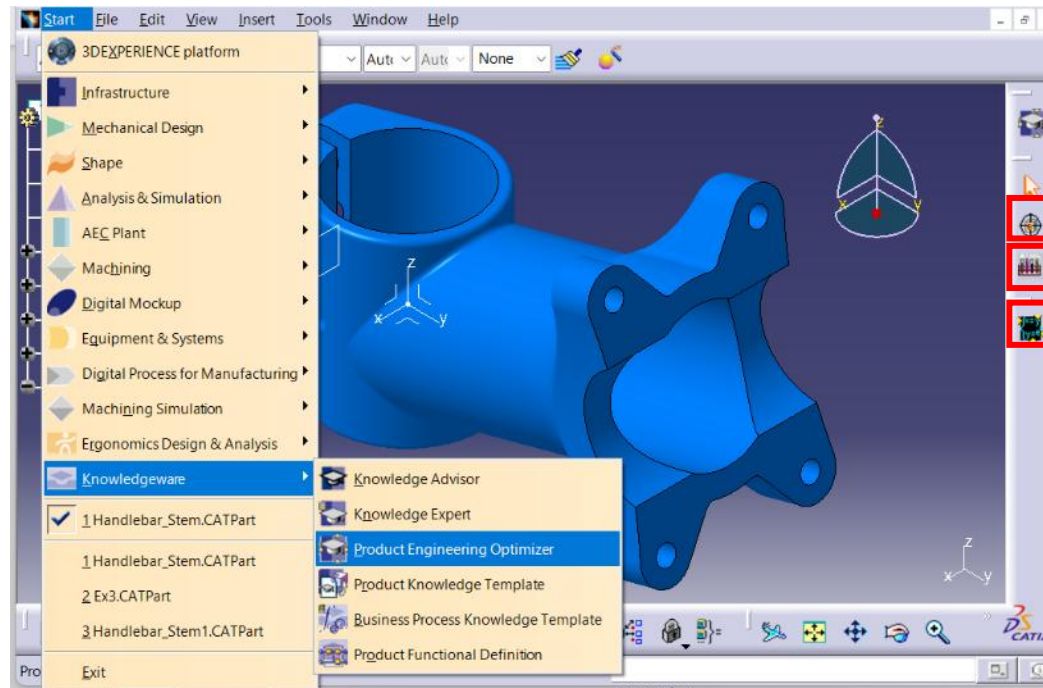

For creating and managing Expert Rules and Checks

Expert Rule Set: a group of expert rules or checks

CATIA's Product Engineering Optimizer

Overview of the tool:

- The Product Engineering Optimizer is the Catia's answer to optimization
- It provides engineers with an easy to use tool based on iterative methods
- Can operate with Local algorithms (*Conjugate gradient*) and Global algorithms (*Simulated Annealing*) to run an optimization depending on the function to analyze

Optimization: Formulates the objective to find the best of all possible values of a function with respect to come constraints

Design of Experiments: Perform virtual experiments considering as many parameters as needed

Constraint Satisfaction: define and manage constraints between geometric elements in a model

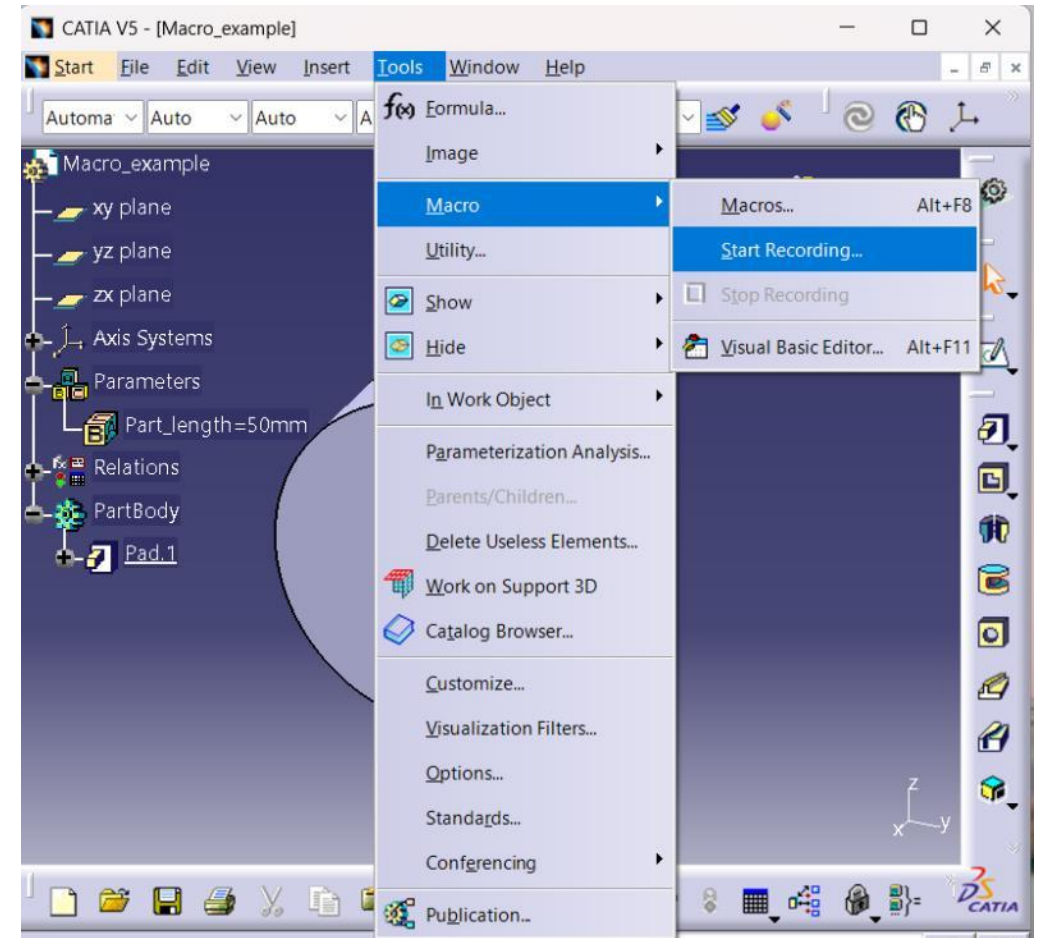

Macros and Scripts in CATIA

Macros:

- Recorded sequences of commands or custom scripts written in Visual Basic for Applications (VBA) that automate repetitive tasks, complex operations, or customized functionalities within the CATIA environment.
- Can interact with CATIA's object model to manipulate parts, assemblies, drawings, and other CATIA elements

Creation methods:

- Recording user actions directly in CATIA
- Writing code manually in the Visual Basic Editor

Macros and Scripts in CATIA

Scripts: key component in automating design processes and embedding engineering knowledge into CAD models.

Types of scripting in CATIA :

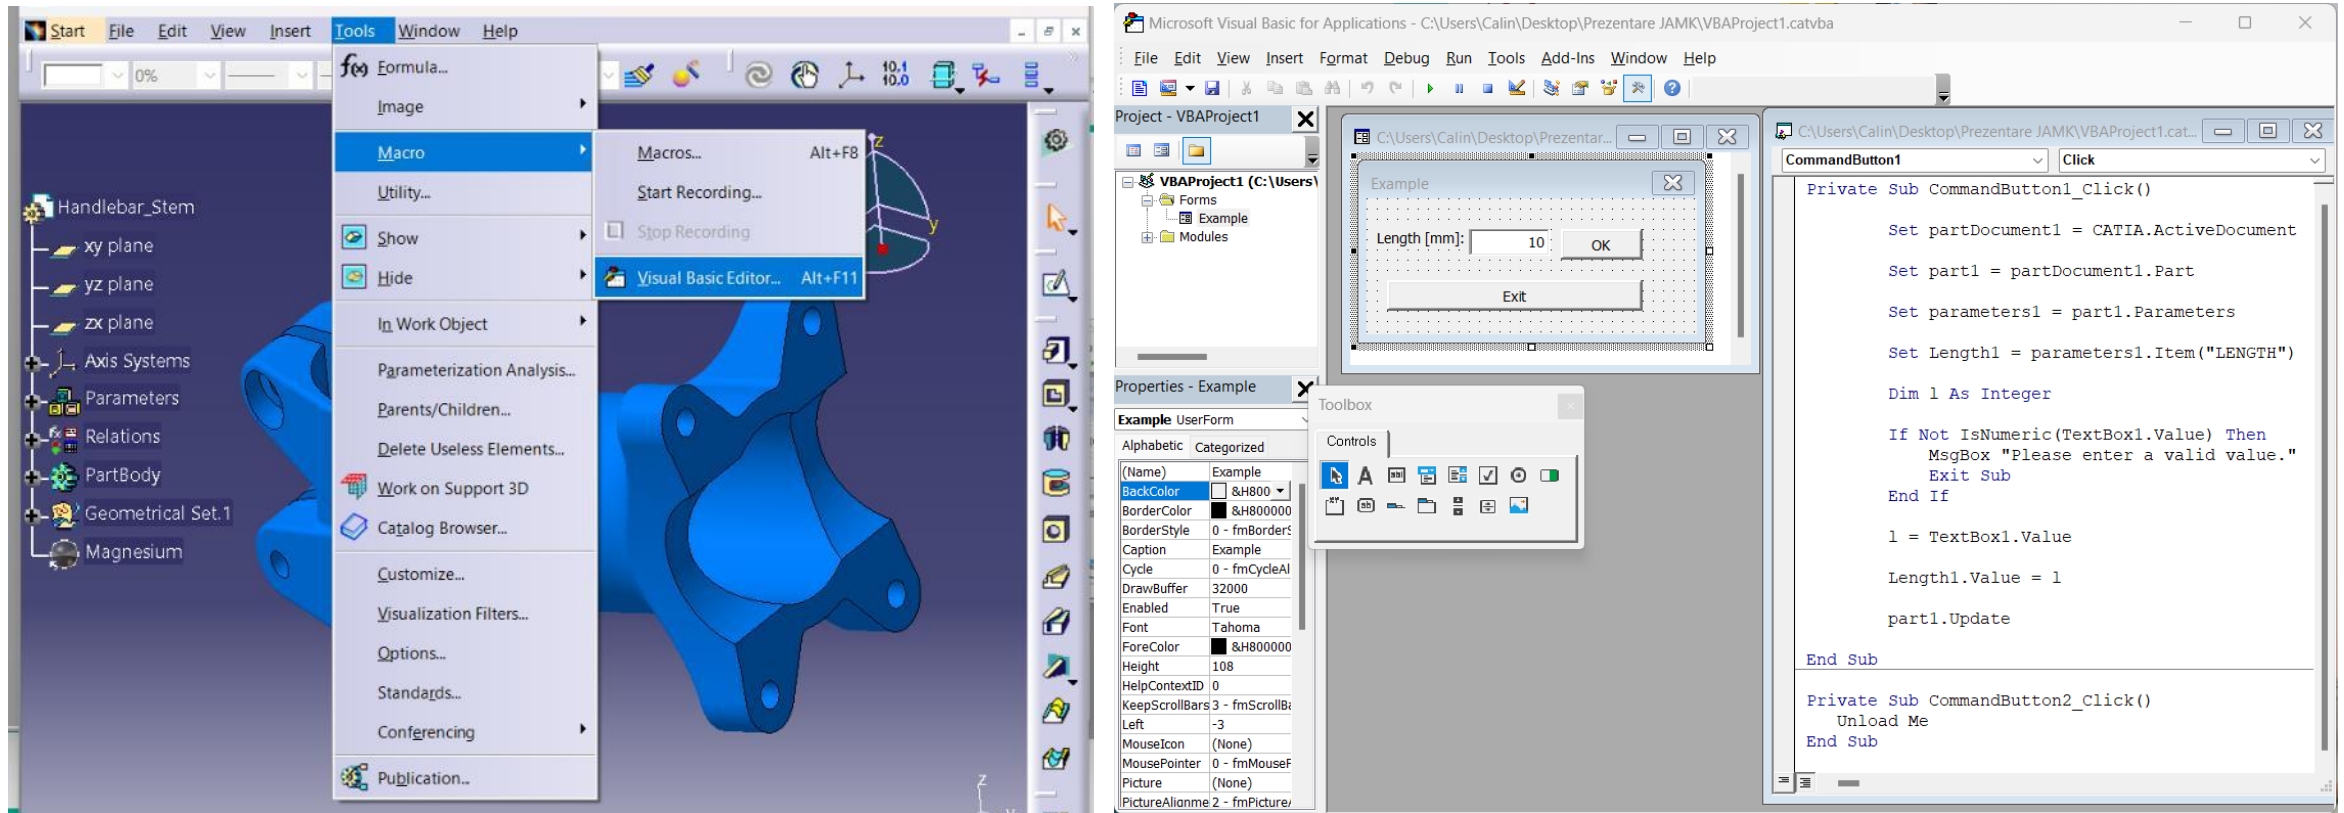

- Knowledge Expert: A CATIA workbench that allows creation of rules and checks without traditional programming.
- VBA (Visual Basic for Applications): The most common scripting language in CATIA.
- CAA (Component Application Architecture): For more advanced C++ based development
- Python: Available in some CATIA environments, especially with newer versions

Advantages over recorded macros:

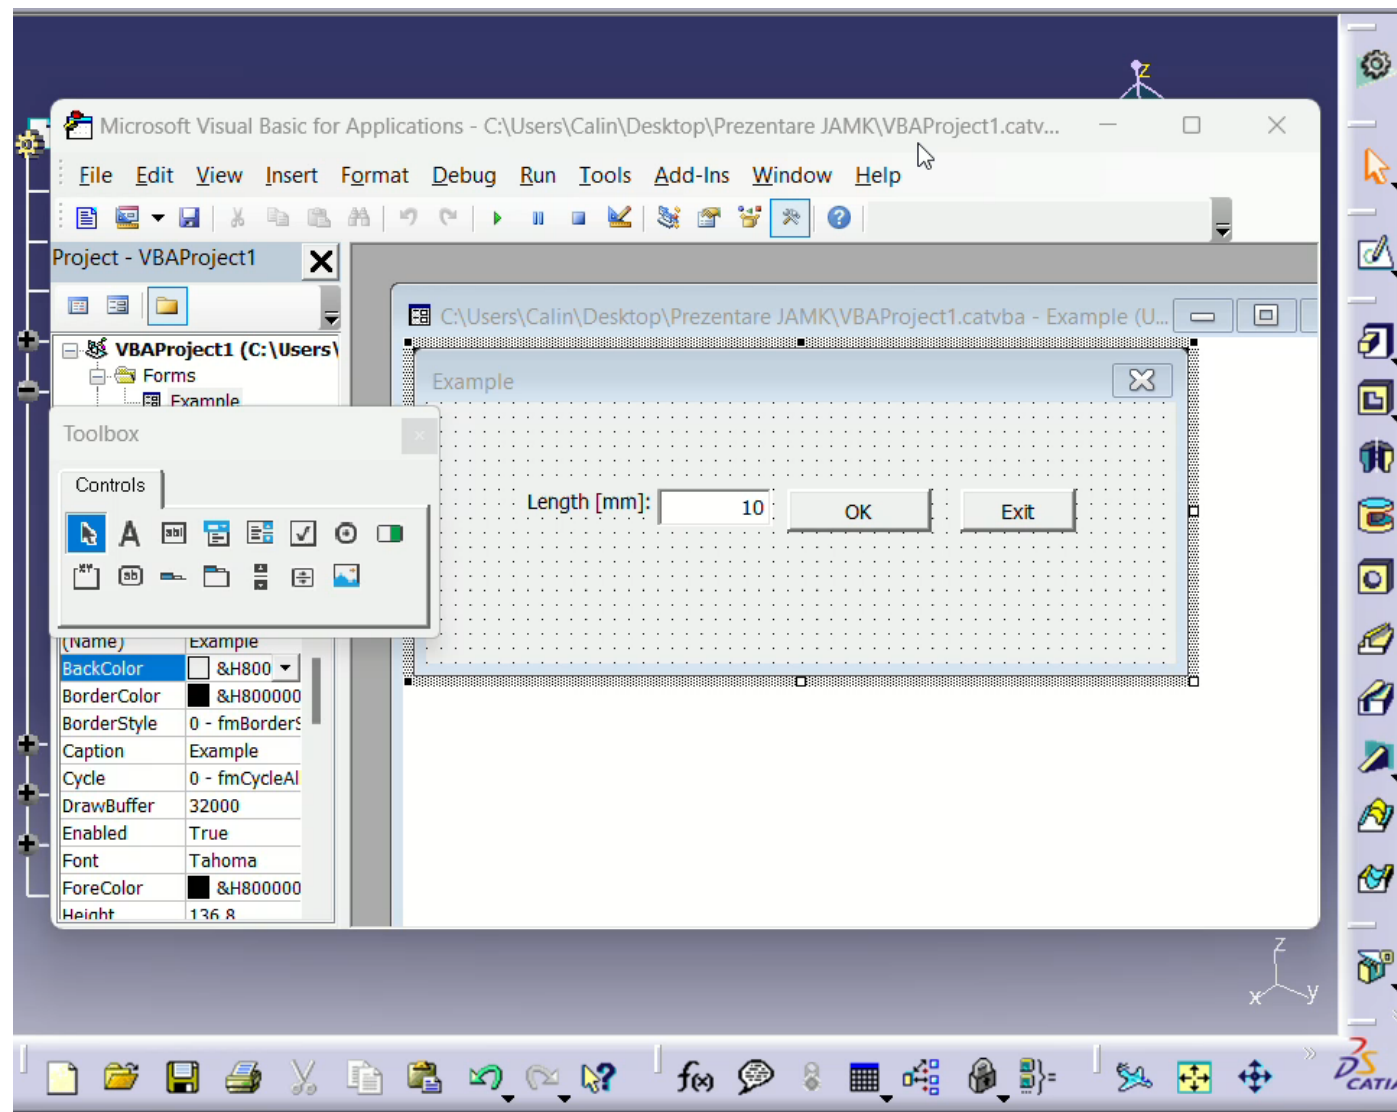

- More flexible and powerful
- Can include complex logic and error handling
- Able to interact with other applications or data sources
- Can be more easily maintained and version-controlled

CATIA's VBA interface

Objective: Create a VBA script for CATIA that allows you to enter a value in a dialog box and change a part dimension accordingly

CATIA's VBA interface

Eco-Friendly Engineering through Parametric Design

Co-funded by
the European Union

Co-funded by
the European Union

Eco-Friendly Engineering through Parametric Design

Eco-friendly engineering also known as *sustainable engineering* or *green engineering*, is the practice of developing products, that are environmentally responsible and resource-efficient throughout their entire life cycle, from raw material extraction to end-of-life disposal or recycling.

Focus Areas:

1. Material Optimization:

- Material selection
- Material usage optimization

2. Weight Reduction Strategies:

- Structural optimization
- Lightweight materials

3. Design for Disassembly (DfD):

- Modular design
- Recycling considerations

Source: <https://convercon.com/embracing-a-sustainable-future-green-engineering-in-product-design/>

Co-funded by
the European Union

Material Optimization

A bike handlebar stem must be:

- **Strong:** Able to withstand the forces exerted by the rider and the handlebars.
- **Lightweight:** To improve bike performance and handling.
- **Durable:** Resistant to corrosion, fatigue, and impact.
- **Aesthetically pleasing:** Align with the overall design of the bike.

Strategies :

- **Consider candidate materials:** Based on the requirements, explore materials like aluminum alloys, steel, carbon fiber, and titanium.
- **Perform structural analysis:** Use Catia's simulation tools to analyze the stem's stress distribution and deflection under various loading conditions (e.g., rider weight, handlebar forces).
- **Evaluate material performance:** Compare the performance of different materials based on factors like stress levels, weight, and cost.
- **Optimize material usage:** Use parametric design to explore different stem geometries and material combinations to find the optimal solution.

Weight Reduction Strategies

Reducing the weight of a bike handlebar stem can improve handling, acceleration, and overall performance

Example of Weight Reduction in CATIA:

- Create a parametric model of the stem, including dimensions and material properties.
- Perform a structural analysis to determine the critical areas of the stem.
- Use topology optimization or generative design to identify areas where material can be removed.
- Modify the stem's geometry based on the optimization results.
- Perform another structural analysis to ensure that the modified design meets performance requirements.
- Compare the weight of the original and modified designs to assess the weight reduction achieved

Design for Disassembly

Design for Disassembly (DfD) involves designing products to make them easier to disassemble and recycle at the end of their useful life. This reduces waste and promotes a circular economy

DfD Strategies for a Bike Handlebar Stem:

- **Parametric design:** Use Catia's parametric modeling capabilities to create modular designs that can be easily modified and adapted.
- **Separate components:** Design the stem as an assembly of separate components, such as the stem body, handlebar clamp, and spacers.
- **Quick-release mechanisms:** Use quick-release mechanisms or fasteners to simplify disassembly.
- **Avoid welding:** Use mechanical fasteners or adhesives that can be easily removed.
- **Recyclable materials:** Choose materials that are easily recyclable, such as aluminum or steel.

3D-scanning

Scanner types

- Desktop scanners are designed for scanning small to medium-sized objects. They often use structured light or laser triangulation technology and are ideal for applications requiring high precision, such as jewelry or dental work.
- Handheld scanners are portable and easy to use. They can be laser-based or structured light-based and are ideal for scanning medium-sized objects in situ or in difficult-to-reach places. They offer flexibility and convenience for various applications.
- Tripod-mounted scanners are portable scanners intended for scanning buildings, industrial sites or other large areas. The scanner is stationary during the measurements and automatically measures 360 degree bubble around the location.

3D-scanning

Scanner types – Laser Scanners

Laser scanners emit laser beams to measure distances and create precise 3D models. They are known for their accuracy and ability to scan complex surfaces, including shiny or dark finishes. Common types include:

- Laser Triangulation Scanners: Use a laser beam and a camera to triangulate the position of points on an object's surface.
- Time-of-Flight Scanners: Measure the time it takes for a laser pulse to travel to the object and back, ideal for scanning large objects or environments.

3D-scanning

Scanner types - Structured Light Scanners

Structured light scanners project patterns of light (such as grids or stripes) onto the object.

- Sensors capture the deformation of these patterns to determine the object's shape.
- Fast and can capture high-resolution data, making them suitable for scanning large areas quickly.

Co-funded by
the European Union

jamk

Universidad de Jaén

3D-scanning

Scanner types – Other Scanners

- Photogrammetry involves taking multiple photographs of an object from different angles and using software to stitch these images together into a 3D model. This method is highly versatile and can be used with standard cameras. It's particularly useful for capturing detailed textures and is often used in cultural heritage preservation. Dimensions of the object are based on reference measurements and are generally not accurate enough for precise engineering purposes.
- 3D scanning apps are available for smartphones and tablets. These apps use the device's camera to capture images and create 3D models. While not as accurate as dedicated scanners, they offer a convenient and accessible way to perform basic 3D scanning.

Co-funded by
the European Union

jamk

Universidad de Jaén

3D-scanning

Scanner types – Other Scanners

- Computed Tomography (CT) Scanners use X-rays to capture detailed internal and external structures of an object. They are commonly used in medical imaging and industrial inspections to create highly accurate 3D models.
- Contact scanners physically touch the object to measure its dimensions. A probe moves across the surface, recording data points. While highly accurate, this method is slower and less suitable for delicate or soft objects.

3D-scanning

Scanner types – Software Tools

- Point Cloud Processing Software: Proprietary software from the scanner supplier or general point cloud processing software like CloudCompare or Geomagic are used to process and clean up point cloud data.
- Mesh processing and other 3D Modeling Softwares: Tools like Blender, MeshLab, and Autodesk Maya can be used to refine and manipulate mesh-based 3D models.
- CAD Software: Used for creating detailed digital solid or surface models from scanned data.

the European Union

jamk

Universidad de Jaén

3D-scanning

Process – Preparation

- Choosing the Scanner: Appropriate type of 3D-scanner is chosen based on the object's size, material, and required detail (e.g., laser scanner, structured light scanner, photogrammetry).
- Cleaning the Object: Ensure the object is clean and free from dust or debris that could interfere with the scanning process.
- Positioning: Object is generally placed in a stable and accessible position.

3D-scanning

Process – Scanning

- Capturing Data: The scanner projects light or lasers onto the object and captures the reflected data. This process involves moving the scanner around the object or rotating the object to capture all angles.
- Point Cloud Generation: The scanner generates a point cloud, which is a collection of data points representing the object's surface.
- Multiple Scans: For complex objects, multiple scans from different angles are often necessary to capture all details.

3D-scanning

Process – Scan Data Processing & Model Creation

- Cleaning Up: Any noise or unwanted data points are removed from the scan.
- Alignment: Multiple scans are combined into a single coordinate system. This step, known as registration, ensures that all scans align correctly.
- Meshing: The point cloud is converted into a mesh, which consists of vertices, edges, and faces that define the object's shape. This step creates a continuous surface from the discrete points.
- Texturing: If color and texture data were captured, this information is applied to the mesh to create a photorealistic 3D model.

the European Union

jamk

Universidad de Jaén

3D-scanning

Applications – Engineering

- Reverse Engineering: 3D scanning is employed to digitize existing products or parts, enabling designers to analyze and improve upon them. This is particularly useful for creating custom or replacement parts.
- Customization: In industries like medical device manufacturing, 3D scanning is used to create custom prosthetics and orthotics that fit perfectly to the patient's body.

3D-scanning

Applications – Construction

- **Quality Control and Inspection:** 3D scanning is used to monitor construction progress and ensure that structures are built according to specifications. It helps in identifying discrepancies early, reducing costly rework.
- **Safety:** By providing detailed scans of construction sites, 3D scanning enhances safety by identifying potential hazards and ensuring compliance with safety standards.
- **Topographic Surveys:** 3D scanning captures detailed information about the terrain and features of a construction site, facilitating site planning and grading activities.

3D-scanning

Applications - Architecture

- **As-Built Documentation:** 3D scanning captures the exact dimensions and details of existing structures, creating accurate as-built models. These models are crucial for renovation projects, ensuring that new designs fit perfectly with existing conditions.
- **Design and Visualization:** Architects use 3D scans to create detailed visualizations of their designs. This helps in presenting concepts to clients and stakeholders, providing a realistic view of the final product.
- **Restoration and Preservation:** Historical buildings and monuments can be scanned to create precise digital replicas in order to aid in restoration efforts or preserve the architectural heritage.

3D-scanning

Other Applications

- Entertainment: In the movie, television, and video game industries, 3D scanning is used to create detailed 3D models of characters, props, and environments. This helps in creating realistic animations and special effects.
- Medicine: 3D scanning is increasingly important in the medical field for creating accurate models of body parts. These models can be used for surgical planning, custom prosthetics, and even for educational purposes.

3D-scanning

Benefits

- **High Precision and Accuracy:** 3D scanners can capture detailed and accurate measurements, which is crucial for engineering and construction.
- **Time Efficiency:** Traditional measurement methods can be time-consuming. 3D scanning drastically reduces the time required to capture complex geometries and environments. Especially combined with Additive Manufacturing 3D-scanning can e.g. expedite cases where spare parts are urgently needed.
- **Comprehensive Data Collection:** A single scan can capture millions of data points, providing a complete and detailed representation of the scanned object or environment. This is beneficial for creating detailed models and conducting thorough analyses.

Co-funded by
the European Union

jamk

Universidad de Jaén

3D-scanning

Benefits

- **Non-Contact Measurements:** 3D scanners use contact-free technology, meaning they can capture data without physically touching the object. This is advantageous for scanning delicate or hazardous objects, as it eliminates the risk of damage or contamination.
- **Versatility and Flexibility:** 3D scanners are versatile tools that can be used in a variety of applications, from industrial inspections and reverse engineering to cultural heritage preservation and medical imaging.
- **Cost Savings:** By reducing the time and labor required for measurements and inspections, 3D scanning can lead to significant cost savings in various projects.

Co-funded by
the European Union

jamk

Universidad de Jaén

BOSCH
Invented for life

3D-scanning

Challenges

- **Technical Complexity:** Operating 3D scanners and processing the data requires specialized knowledge and skills, and usually plenty of processing power from the computers.
- **Data Accuracy:** While 3D scanners are generally accurate, certain factors like surface reflectivity, ambient light, and scanner calibration can affect the accuracy of the data.
- **High Initial Costs:** The initial investment in 3D scanning equipment and software can be high. This includes the cost of the scanner, software licenses, and potentially powerful computers for data processing.

Co-funded by
the European Union

jamk

Universidad de Jaén

BOSCH
Invented for life

3D-scanning

Challenges

- **Data Processing Time:** Although scanning itself is fast, processing the data to create usable 3D models can be time-consuming, especially for large or complex objects.
- **Environmental Sensitivity:** Some 3D scanners are sensitive to environmental conditions such as lighting, temperature, and vibrations, which can affect the quality of the scans.
- **Intellectual Property Issues:** Reverse engineering through 3D scanning can raise intellectual property concerns, especially if the scanned object is protected by patents or copyrights.

Co-funded by
the European Union

jamk

Universidad de Jaén

3D-scanning

Trends and future outlook

- **AI-Driven 3D Scanning:** Artificial intelligence (AI) is increasingly being integrated into 3D scanning technologies. AI can enhance the accuracy and speed of data capture, automate data processing, and improve the overall quality of 3D models. AI-driven 3D scanning can also help in real-time data interpretation and error correction.
- **Cloud-Based 3D Data Processing:** Cloud computing is transforming how 3D scan data is processed and stored. Cloud-based solutions allow for faster processing, easier collaboration, and more efficient data management. This trend is particularly beneficial for large-scale projects that require significant computational power.

Co-funded by
the European Union

jamk

Universidad de Jaén

3D-scanning

Trends and future outlook

- **Mobile 3D Scanning:** Advancements in mobile technology are making 3D scanning more accessible. Smartphones and tablets equipped with advanced cameras and sensors can now perform basic 3D scans. This trend is democratizing 3D scanning, making it available to a broader audience.
- **Drone-Based 3D Scanning:** Drones equipped with 3D scanning technology are being used for aerial surveys and mapping. This approach is particularly useful for large-scale projects, such as construction site monitoring, environmental studies, and agricultural assessments.

Co-funded by
the European Union

jamk

Universidad de Jaén

3D-scanning

Trends and future outlook

- **AR and VR Integration:** Augmented Reality (AR) and Virtual Reality (VR) are being integrated with 3D scanning to create immersive experiences. This integration allows users to interact with 3D models in real-time, enhancing applications in fields like education, training, and design.
- **BIM and Digital Twin Integration:** Building Information Modeling (BIM) and digital twins are becoming integral to 3D scanning. These technologies allow for the creation of detailed digital replicas of physical structures, which can be used for maintenance, planning, and simulation purposes.

Co-funded by
the European Union

jamk

Universidad de Jaén

3D-scanning

Trends and future outlook

- **Enhanced Accuracy and Resolution:** The relentless pursuit of higher accuracy and resolution continues to drive innovation. New hardware solutions, refined algorithms, and AI-powered models are pushing the boundaries of what 3D scanners can achieve, aiming for sub-micron accuracy.
- **Portability and Miniaturization:** Improvements in sensor technology and processing power are leading to smaller, more portable 3D scanners. These portable devices are easier to use in the field and can capture high-quality data without the need for bulky equipment.
- **3D Scanning Automation:** Automation is simplifying the scanning process, reducing manual labor, and increasing productivity. Automated systems can handle tasks like point cloud conversion and data cleaning, making the entire workflow more efficient.

Reverse Engineering

Process

Obtaining the Object, Disassembly or Deconstruction

- The first step is to acquire the object or system you want to reverse engineer. This could be a physical device, a mechanical part, an electronic circuit, or software code.
- The object is disassembled to access its individual components and internal structure. For physical objects, this might involve taking apart mechanical parts or electronic devices.

About NextGEng Project

- **NextGEng Project** aims to create new pedagogical models that promotes international team-teaching with the support of new learning materials for existing courses in the curricula

NextGEng comprises three types of activities

Ecodesign

Upon completion of this module, the student will be able to:

- 1) Integrate sustainability principles into the design process, ensuring that products have a minimal environmental impact throughout their lifecycle.
- 2) Apply ecodesign strategies to develop innovative and sustainable product solutions that meet both technical and environmental standards.
- 3) Select the most eco-friendly options for industrial design components.
- 4) Collaborate effectively in multidisciplinary teams to create sustainable product designs

Ecodesign

Today's class will be divided into three blocks:

- Theoretical presentation on the use of eco-design strategies
- Presentation of successful case studies applying eco-design criteria
- Resolution of a practical case in groups

Introduction

What benefits do we get from using ecodesign?

- **Optimization of the use of resources:** Through the choice of sustainable materials, ecodesign seeks to use resources efficiently, favoring those that are recycled or come from renewable sources

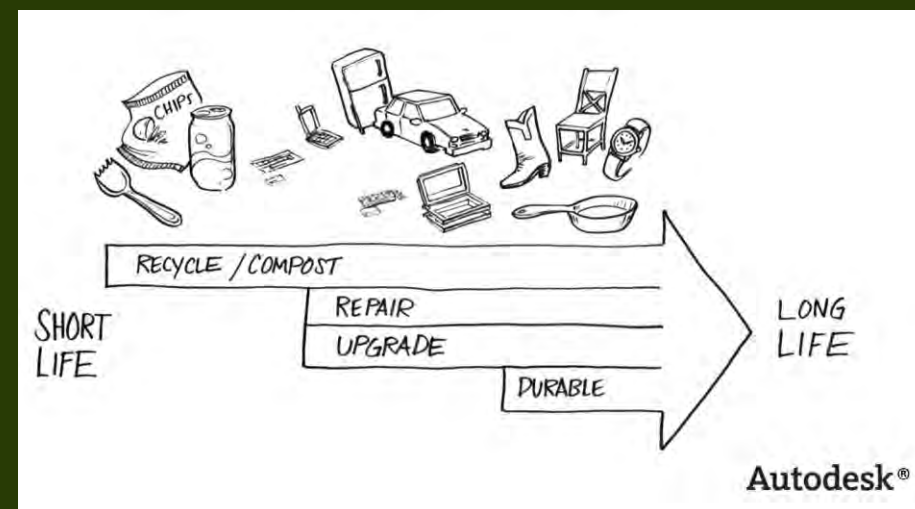

- **Optimization of the use of resources:** Through the choice of sustainable materials, ecodesign seeks to use resources efficiently, favoring those that are recycled or come from renewable sources
- **Waste minimization:** Favor the design for disassembly, facilitating the recycling or reuse of product parts once it has reached the end of its useful life

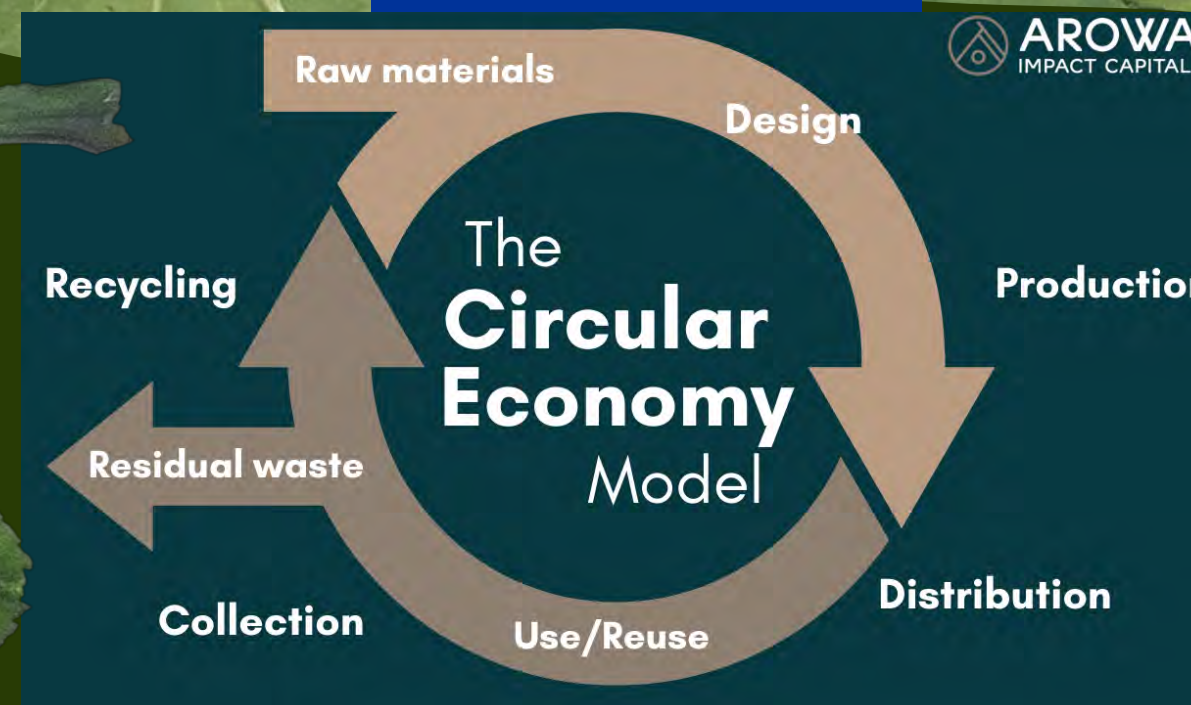

- **Optimization of the use of resources:** Through the choice of sustainable materials, ecodesign seeks to use resources efficiently, favoring those that are recycled or come from renewable sources
- **Waste minimization:** Favor the design for disassembly, facilitating the recycling or reuse of product parts once it has reached the end of its useful life
- **Lifecycle extension:** Design durable, modular products that can be easily repaired or upgraded to extend their useful life

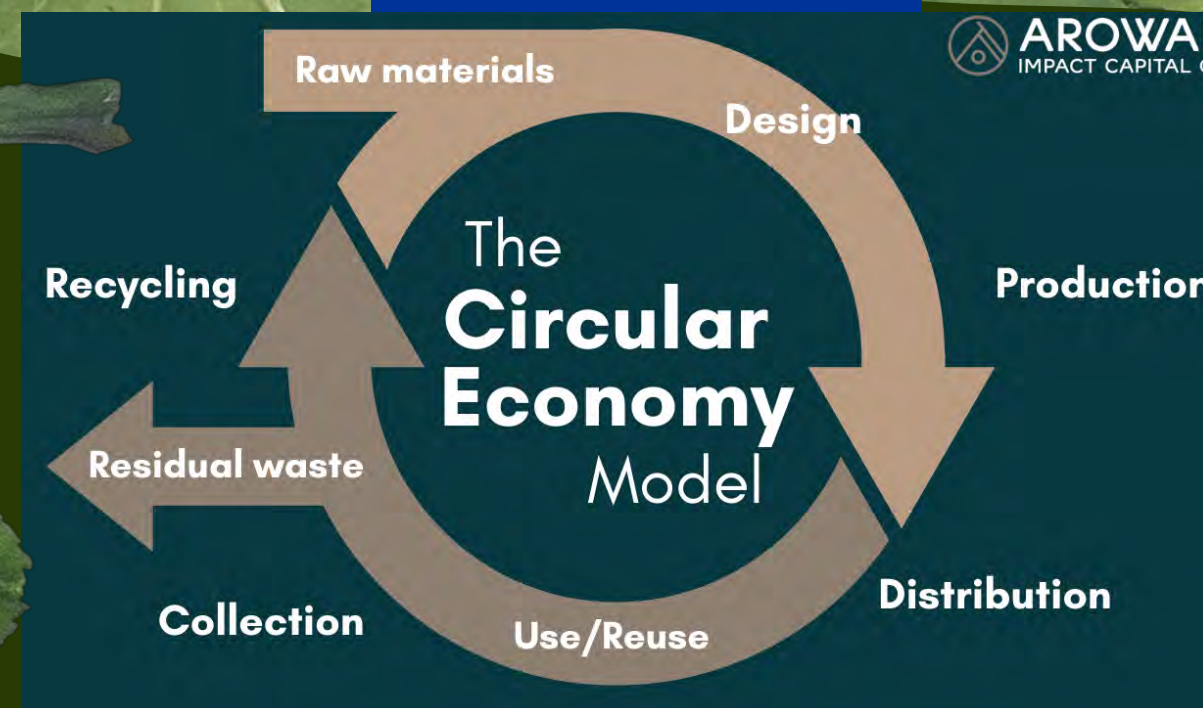

Why use ecodesign?

Reglamento (UE) 2024/1781 del Parlamento Europeo y del Consejo, de 13 de junio de 2024, por el que se instaure un marco para el establecimiento de requisitos de diseño ecológico aplicables a los productos sostenibles, se modifican la Directiva (UE) 2020/1828 y el Reglamento (UE) 2023/1542 y se deroga la Directiva 2009/125/CE.

Publicado en: «DOUE» núm. 1781, de 28 de junio de 2024, páginas 1 a 89 (89 págs.)
Departamento: Unión Europea
Referencia: DOUE-L-2024-80992

“EU Regulation 2024/1781

It should provide for the establishment of new ecodesign requirements to improve the durability, reliability, reparability, upgradeability, reusability and recyclability, improving the reconditioning and maintenance possibilities of products”

**And what strategies are
we going to use to
achieve these objectives?**

- **Choose the Right Materials:** Use recycled or renewable materials that have less impact on the environment.
- **Design for Durability:** Make sure your product lasts longer, which means fewer replacements and less waste over time.
- **Make It Easy to Repair:** Design products so they can be easily fixed. This helps extend their life and reduces the need for new products.

- **Plan for Recycling:** Think about how the product can be taken apart and recycled at the end of its life.
- **Use Energy Wisely:** Opt for energy-efficient processes during manufacturing and aim to reduce energy use while the product is in use.

Chemical Recycling Poised to Take Off

Investments in chemical-recycling facilities abound as the industry moves closer to the Circular Economy model, accompanied by plenty of new rollouts of packaging made from chemical recycling.

MEX PROCESS

The image shows a detailed jewelry design process. A hand is pointing to a specific sketch of a ring on a white sheet of paper. The paper is filled with various sketches of jewelry pieces, including rings, pendants, and earrings. Handwritten notes in Italian provide details about the designs, such as "BZIU BIANCO PT 1/2", "GATTO PER BZIU DA PT 2 CAD", and "IL BORDO PUNTERE SFONATO ED ESSERE BOMBATO DA UN LATO SFORNANDO A 90° CON BZIU BIANCO". A small black card with the text "fabrizio gioielli" is visible in the upper left corner. A green leafy branch is placed across the top right of the page.

(54) Título: **Dispositivo para la colocación y retirada de calcetines y medias**

(57) Resumen:
Dispositivo para la colocación y retirada de calcetines y medias.
La invención describe un dispositivo para la colocación y retirada de calcetines y medias que comprende un cuerpo base (1, 1') formado por un elemento guía del pie (1), un elemento soporte superior (1') conectado a un lateral del elemento guía del pie, un sistema de fijación (7) configurado para fijar la posición relativa entre ambos elementos (1, 1'), una pluralidad de casquillos (2, 3) y tetones de sujeción (4, 4', 5) del calcetín conectados con el elemento guía del pie (1) y el soporte superior (1') con posicionamiento variable entre ambos elementos tal que el movimiento de rotación del cuerpo base (1, 1') provoca el posicionamiento y elevación del pie para la colocación precisa del calcetín sobre el pie y el movimiento de traslación del cuerpo base (1, 1') ayuda a la colocación del calcetín de forma completa sobre la extremidad inferior, estando ambos movimientos guiados por el mango extensible (13).

Team work

45 min

- **Choose the Right Materials:** Use recycled or renewable materials that have less impact on the environment.
- **Design for Durability:** Make sure your product lasts longer, which means fewer replacements and less waste over time.
- **Make It Easy to Repair:** Design products so they can be easily fixed. This helps extend their life and reduces the need for new products.
- **Plan for Recycling:** Think about how the product can be taken apart and recycled at the end of its life.
- **Use Energy Wisely:** Opt for energy-efficient processes during manufacturing and aim to reduce energy use while the product is in use.

- 
- **Choose the Right Materials:** The device was made with **PLA** material.
 - **Design for Durability:** A **simple** design is created according to the client's requirements, which will not include any sensors that could fail.
 - **Make It Easy to Repair:** The product that can be repaired in parts; they could be supplied to the customer, or the **customer could make them himself**. The handle can be used from other products
 - **Plan for Recycling:** Biodegradable material like PLA
 - **Use Energy Wisely:** Manufactured with additive technology for most of the components, it is supplied folded to reduce transportation and packaging costs

Thank you!!

Agriculture application: Olive Harvest

Traditionally, the olive harvesting process has been done manually. This manual process required a lot of labor and time.

Recently, new systems and assemblies have been designed which, with the help of tractions, reduce the effort, time and labor used during the olive harvesting process.

(54) Title: ELECTRONIC HIKING POLE

(54) Título: BASTON ELECTRONICO DE SENDERISMO

FIG.1B

(57) Abstract: The invention relates to an electronic hiking pole which can act as a conventional pole for sport practice and as an electrical generator for producing electricity from primary energy sources such as wind energy and hydraulic energy. The electronic hiking pole comprises: a gripping part (10) having at least one housing body (12) that laterally surrounds a handle (11), leaving at least one free entrance (A) sufficient for the insertion of a hand, the gripping part (10) assembly being rotatable about the imaginary axial axis of the handle (11); a central tube (20) which contains an electrical generator (23), a junction box (24) and a battery (25), the generator (23) having a rotary shaft (23A) inserted into a lower end of the handle (11), such that the rotary movement of the gripping part (10) causes the mutual rotation of the shaft (23A) of the generator (23), thereby generating electrical energy which is stored in the battery (25).

(57) Resumen: Permite actuar como bastón convencional para la práctica deportiva, y como generador de electricidad a partir de fuentes de energía primarias, tales como la energía eólica e hidráulica, comprendiendo una empuñadura (10) que tiene al menos un cuerpo envolvente (12) que rodea al mango (11) lateralmente dejando al menos un acceso libre (A) suficiente para la inserción de una mano, donde el conjunto de empuñadura (10) es giratorio sobre el propio eje axial imaginario del mango (11); un tubo central (20) que aloja en su interior un generador (23) eléctrico, una caja de conexiones (24) y una batería (25), donde el generador (23) tiene un eje (23A) giratorio insertado en un extremo inferior del mango (11); tal que el movimiento giratorio de la empuñadura (10) provoca el giro solidario del eje (23A) del generador (23), produciendo así la generación de energía eléctrica, siendo ésta almacenada en la batería (25).

Advantages and disadvantages

- High level of detail and accuracy
- Smooth and finely finished surfaces
- Wide range of material options
- Ability to create complex geometries and intricate designs
- Supports for small and intricate parts
- Intuitive technology
- Efficient use of materials
- Prototyping and iteration
- Smooth integration with post-processing techniques
- Great for visualizing concepts
- Wide range of applications

- Higher cost compared to other 3D printing methods
- Limited build size
- Longer printing times compared to some other 3D printing technologies
- Higher skill level required for successful printing and post-processing.
- Resin exposure to UV light can be dangerous
- Certain types of resins can be messy and may leave behind residue on surfaces or clothing.
- Resins can also emit odors or fumes during printing
- Resins have a limited shelf life
- Certain resins may be sensitive to environmental factors like temperature and humidity, which can affect print quality.
- The final printed object may not be as durable or strong as those produced with other 3D printing technologies

Universidad de Jaén

- Highly accurate parts with resolution down to 14 microns
- Due to high accurate layer resolution, it can produce smooth parts with surfaces comparable to injection moulding and very high dimensional accuracy
- Low wastage due to accurate jetting and material on-demand dropping technology, unlike processes like powder bed fusion where sintering takes place inside the power chamber
- Multi-material and multi-colour capability within the same print volume
- Material Jetting has homogeneous mechanical and thermal properties

- Material jetted parts are mainly suitable for non-functional prototypes, as they have poor mechanical properties. Regarding mechanical properties, NPJ and DOD produce better parts than PolyJet.
- Mechanical properties of photosensitive material used in PolyJet degrade over time quickly.
- MJ machines are still expensive compared to other AM technologies, making them unfeasible for some applications.
- Produces relatively brittle parts, making it difficult to use in a production load-bearing part
- Although it's easier to remove, most of the parts often require support material.
- High accuracy can be achieved, but materials are limited. PolyJet can only be used with polymers and waxes.

Co-funded by
the European Union

jamk

Universidad de Jaén

Drop on demand

- two print heads and two cartridges for main and support materials;
- Each layer is printed similarly to how generally AM technologies work.
- Each layer is precisely milled to keep the layer thickness and flatness
- Support material is automatically laid down / no need for support design
- The support dissolves away leaving a high-precision wax model.

Invented for life

1. **Precision and Accuracy:** DOD provides highly precise and accurate droplet placement. It can be easily used in microelectronics and medical devices. Resolution of $\pm 22 \mu\text{m}$ in X & Y and $25 \mu\text{m}$ for layer thickness
2. 5000 \times 5000 drops per inch dropping resolution produces high-definition parts
3. It can print both resin and wax.
4. **Material Efficiency:** This method can efficiently deposit material only where needed, reducing waste and making it suitable for intricate geometries and lightweight structures.
5. **Versatile Use:** DOD can handle a variety of materials, including waxes, photopolymers, and other specialised fluids.

https://engineeringproductdesign.com/knowledge-base/material-jetting/#What_is_Material_Jetting

1. **Build Speed:** - in case of DOD, the printing speed is lower compared to other 3d printing technology. Not usable for large scale production.
2. **Material Limitations:** Low range of materials that can be used. Usable in jewelry and electronics and not in the industry board.
3. **Post-Processing:** It is necessary to post process the workpieces, which means more effort and time in order to obtain the finished part.

Typical machine

System Parameters

Bauraum in mm (x/y/z)	248 x248 x 250 (350)
Build Chamber in mm (x/y/z)	
Laserleistung	200/400 W, YLR-Faser-Laser
Laser Power	
Baugeschwindigkeitsrate*	20 ccm/h
Build Speed Rate*	
Prakt. Schichtdicke	20 µm - 75 µm (100 µm)
Pract. Layer thickness	
Min. Spurbreite / Wandstärke	150 µm
Min. Scan Line / Wall Thickness	
Operativer Strahlfocus frei wählbar	60 µm - 100 µm (85 µm - 130 µm)
Operational Beam Fokus variable	
Belichtungsgeschwindigkeit	20 m/s
Scan Speed	
Schutzgasverbrauch im Prozess	Ar/N ₂ , 1,5 l/min
Inert Gas Consumption in Operation

b)

diameter between 10 µm to 90 µm

- pure titanium (Ti)
- titanium alloy (Ti6Al4V)
- Co-Cr
- Aluminum
- nickel (Inconel 625, 718)

Titanium Alloy TiAl6V4:

420 – 540 €/kg

Pure Titanium Grade 1 or 2:

360 – 480 €/kg

Stainless Steel 316L (1.4404):

70 – 110 €/kg

Cobalt Chromium Alloy (CoCrWMo):

240 – 370 €/kg

Quality indicators for the metal powder:

- d90 value (90% of the particles are smaller than 90 microns;
- Flowability - time necessary for 50 grams to flow gravitationally through an orifice of 2,5 mm diameter (s/50 – ASTM B213). Typically the flow rate is between 15 and 40 sec.

When to use SLM?

- functional, end-use parts
- Prototyping in production
- Low volume production (Qty < 250)
- Highly complex geometry which is impossible to generate through other technologies
- Where is needed low weight part (using Lattice structures)
- Specific requirement for workpieces that are used under in high temperature or in corrosive solutions.

- PVD Manufacturing process / technology
- PVD (evaporation and ion plating) – the material is heated by induction, radiation, electron beam or LASER. In the spraying stage, the material with which the coating is made is not melted. Ion bombardment of the materials/cover plates is performed.

https://www.youtube.com/watch?v=9OEz_e9C4KM

- The techniques can be used for direct deposition of material for "reactive" use, in which reaction occurs in the vapor phase (in the form of plasma) between the atoms of the coating material and the reactive gases.
- Usually, the coating temperature does not exceed 200-400°C. Considerably lower than in the case of CVD. In special cases, higher temperatures can also be reached, but only if necessary.
- For uniform coverage, rotation of parts in the installation is practiced.
(https://www.youtube.com/watch?v=CK1eic4r73I&ab_channel=GuehringTV)
- The vacuum level is 0.1 – 1 Pa.

- The maintenance time of the parts in the plasma environment depends on their shape, their number, the type of material to be deposited and the thickness of the layers.
- The deposition rate is generally between 50 and 500 $\mu\text{m/h}$, depending on the technology.
- The costs are higher than in the case of CVD (usual). However, in some cases they do not exceed 1% of the total production costs of some components.
- It can be applied to a very wide variety of components, including decorative ones (on glass, plastic or even organic materials, corrosion-resistant tubes, coatings resistant to abrasive, corrosive wear, cutting tools.
- From an industrial point of view, it is most often found when covering cutting tools.

CVD Process

- Basic principle:
- condensation of products obtained from chemical reactions produced between the gases of a reactor;
- Technologies used: - Low Pressure CVD (LPCVD – uniform layers are deposited in terms of thickness and properties but temperatures above 600 °C and catalyst substances are required;
- Plasma enhanced CVD (PECVD) - the plasma introduced promotes chemical reactions and lower temperatures are required (< 300 °C);
- Atmospheric pressure CVD (APCVD).

Epitaxy = „Orderly Rise Above”

- Homoepitaxy - The film and the substrate are made of the same material (e.g. Si pe Si). It is used to improve surface quality or add a pure, flawless coating.
- Heteroepitaxy - The deposited material is different from that of the substrate (e.g. GaN on Si). Used in special MEMS or optical/IR sensors.
- Pseudohomoepitaxy – the deposition and the substrate are the same material but with different dopings.

- Oxidarea termică presupune oxidarea stratului de siliciu superficial dinspre exterior înspre interior:

- pentru calități satisfăcătoare ale stratului de oxid de Si, se optează pentru oxidarea termică în mediu O₂ sau în vapori de apă.
- În mediu de oxigen pur, creșterea stratului se face lent dar cu calități bune (din punct de vedere electronic, cu impurități puține);
- Oxidarea în vapori de apă conține mai multe defecte dar se produce mai rapid (mascare, izolare cu grosimi de strat de ordinul Angström-ilor);
- Si- se oxidează și în mediul ambiant dar grosimea oxidului este de ordinul 2-3 straturi atomice. Acest strat protejează structura de bază de o continuă oxidare.
- Pt 1micron de SiO₂ este necesar de 0,46 microni de Si.
- Există posibilitatea apariției diferențelor de nivel pe suprafață în cazul oxidărilor izolate.

Silicon dioxide (SiO_2) is used as an electrical insulating layer and sacrificial layer in the manufacture of MEMS. It has good chemical resistance, making it ideal for protecting and passivating components. It is compatible with silicon and allows for fine shaping by corrosion. It is also used for thermal insulation or lithography.

Design for AM

Printability

- Geometry directly influences the printability of the part
- Requirements vary depending on the printing methods
- Need for support structures can be minimized by taking into account the limitations imposed by the chosen printing method
- As a rule of thumb, part can be expanded at 45° outside of the previous layer

a) Self supporting cross sections for holes and channels

b) Holes requiring support during printing

Design for AM

Support Structures

- Printing "on top of nothing" is rarely possible
- Separate support structures are used when needed
- Supports are usually made from the same material as the part itself, but in some cases a special support material can be used
- In metal printing, the supports also conduct the heat away
- Need for supports depends on the geometry of the part, the printing method used and the quality and dimensional accurate requirements for the manufactured part

Design for AM

Rethinking structures and assemblies

Assemblies can be replaced by a single part:

- Reduced weight
- Assembly phase speed-up
- Fewer parts that can have failures or defects
- Logistical benefits
- Topology optimization and generative design

Co-funded by
the European Union

jamk

Universidad de Jaén

Design for AM

Generative design

Functional Parts

Create the assembly context of the working environment and link parts that interface with the gripper into the empty optimization part

Design Space with IN & OUT Features

Associative to the linked functional parts, IN & OUT features define where material is mandatory or forbidden inside the allowed design space

Loads & Constraints

The loads & constraints as fixed or pinned occurring on the gripper are defined for the IN & OUT features

FEM Validation

After the topology optimization the result is delivered with the connected FEM simulation for stress & deformation

Final Design

The resulting geometry from the topology optimization can directly be modified and finished ready for 3D-printing

Design for AM

Mass production

Process optimization for mass production

- Optimal orientation for minimization of the need for supports and post-processing
- Manufacturing as many parts as possible in one printing run (Nesting)

[BMW]

Co-funded by
the European Union

jamk

Design for AM

Nesting

- The whole printing chamber is used during a printing run
- Possible to manufacture multiple different parts simultaneously
- Specialized programs available for Nesting

Simulation

- Printing can be simulated
 - Testing the printing settings and avoiding possible issues
 - Minimizing the amount of support structures
 - Minimizing the printing time
 - Simulating the microstructure, shape variations, internal tensions

Co-funded by
the European Union

jamk

Design for AM

Material Selection

- Balancing between technical requirements, costs, sustainability etc

	FDM	SLA	SLS
Pros	Low-cost consumer machines and materials available	Great value High accuracy Smooth surface finish Range of functional materials	Strong functional parts Design freedom No need for support structures
Cons	Low accuracy Low details Limited design compatibility High cost industrial machines if accuracy and high performance materials are needed	Sensitive to long exposure to UV light	More expensive hardware Limited material options
Applications	Low-cost rapid prototyping Basic proof-of-concept models Select end-use parts with high-end industrial machines and materials	Functional prototyping Patterns, molds, and tooling Dental applications Jewelry prototyping and casting Models and props	Functional prototyping Short-run, bridge, or custom manufacturing
Materials	Standard thermoplastics, such as ABS, PLA, and their various blends on consumer level machines. High performance composites on high cost industrial machines	Varieties of resin (thermosetting plastics). Standard, engineering (ABS-like, PP-like, flexible, heat-resistant), castable, dental, and medical (biocompatible). Pure silicone and ceramic.	Engineering thermoplastics. Nylon 11, nylon 12, glass or carbon-filled nylon composites, polypropylene, TPU (elastomer).

Design for AM

Material Selection

- AM parts are anisotropic
- Strength of the part can vary significantly depending on the printing orientation
- The layers can separate from each other (delamination)
- Must be taken into consideration especially in material extrusion –based AM

Invented for life

AM Materials

Recycling printing materials

Thermoplastics (Thermosoftening Plastics)

- No permanent chemical bonds, can be remelted – Easy to recycle
- Includes most filaments and powder bed materials

Thermosets (Thermosetting Plastics)

- Permanent chemical bonds are formed during printing and cannot be reversed – Not recyclable
- Includes most Photopolymerization materials

Co-funded by
the European Union

Sustainable Design

6R –model of Sustainable Design

- Reduce – Use of resources is reduced in every stage of the product lifecycle
- Recover – Disassembly of the product and sorting of recoverable components and materials
- Remanufacture – Product is refurbished, repaired or rebuilt using existing parts when possible
- Reuse – Components of the product are reused elsewhere
- Recycle – Materials from the product or it's components are recycled
- Redesign – The product is redesign, so that it is possible to reduce resource usage, repair and refurbish the product, reuse the components, and recycle the materials

Additive Manufacturing

Summary

- AM as a term is an umbrella for various printing methods
- AM is one method of manufacturing among the others
- Has it's own pros and cons & requirements
- Does not replace any of the traditional methods of manufacturing directly, but supplements them
- Requires understanding and knowledge already in design phase
- Not only prototyping and playing around, but a serious manufacturing method, that is already widely used and growing rapidly

Co-funded by
the European Union

jamk

Design for AM

Things to consider

- DfAM – is the part designed for printing?
- Deformations (bending, shrinkage) and especially in metal printing the effect of the temperature
- Detachment from the printing plate (sufficient surface area, additional support structures when needed)
- Material selection (temperature, chemicals, other requirements posed by the environment e.g. UV light)
- Utilizing the advantages of AM including Sustainable Design

About NextGEng Project

- **NextGEng Project** aims to create new pedagogical models that promotes international team-teaching with the support of new learning materials for existing courses in the curricula

NextGEng comprises three types of activities

Content

- Introduction – General aspects of 3D printing processes
- Topic 1: Most used materials
 - Topic 1.1: Polymers
 - Topic 1.2: Metals
 - Topic 1.3: Other materials
- Topic 2: New trends in 3D printing materials
 - Topic 2.1: 4D printing
 - Topic 2.2: Sustainability of Additive Manufacturing
- Topic 3: Real-life success stories

Introduction

Co-funded by
the European Union

Introduction

General aspects of 3D printing processes

- **Additive Manufacturing:**

Revolutionary technology with a lot of possibilities. It creates 3D objects layer by layer from a digital design.

- **Key factors:**

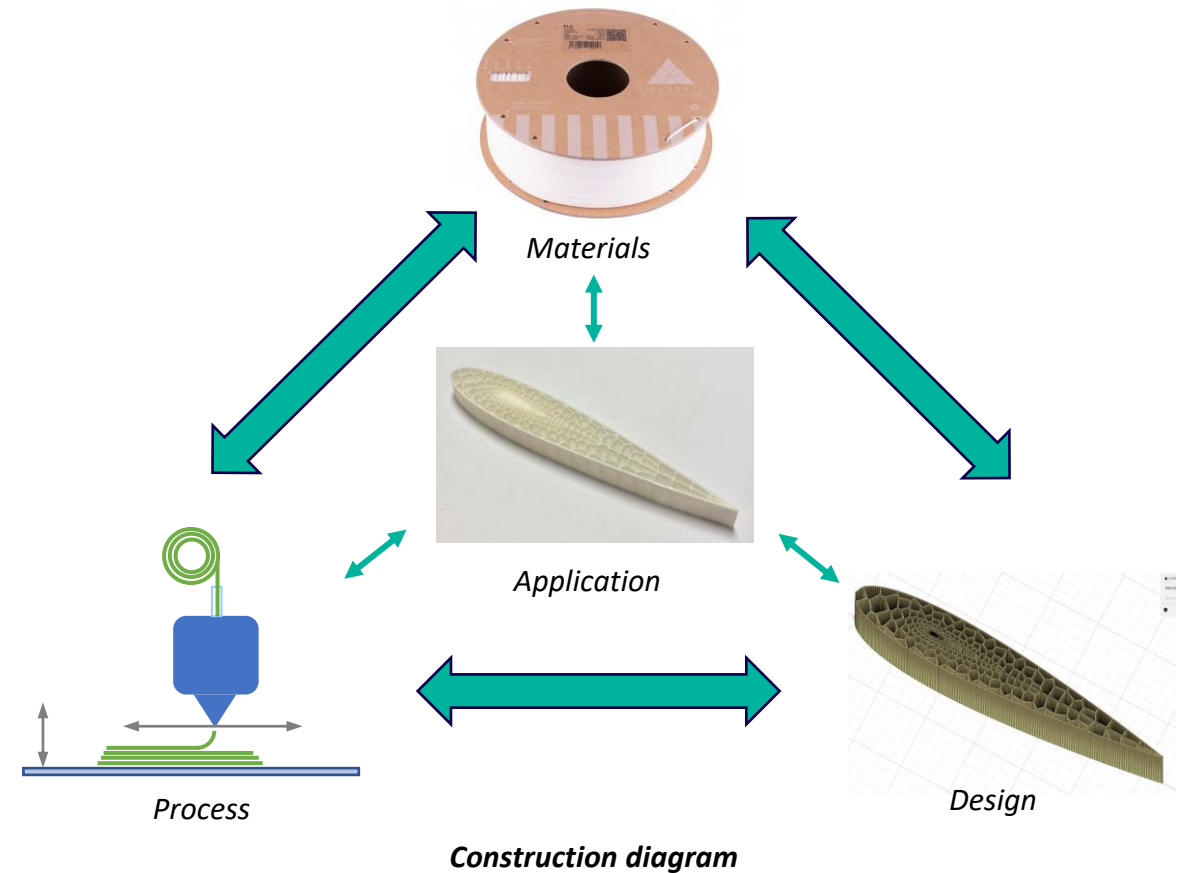

Wide range of materials that can be used to produce objects with different properties and characteristics. These include plastics, metals, ceramics, composites, and even biological materials

It enables the production of **complex and intricate designs** that were previously very difficult to create.

- **Construction diagram:**

There is a relationship between the additive manufacturing process, the material and the design.

The development of new materials leads to more complex designs that allow the manufacture of parts with increasingly novel applications.

Introduction

- How does AM work? Steps of an Additive Manufacturing process

1

Design of digital 3D model with a CAD software

2

Design discretization.
Generation and manipulation of the STL file

Introduction

- **Additive Manufacturing materials according to technologies**

Diagram showing the main materials arranged according to technology

Topic 1: Most used 3d printing materials

Co-funded by
the European Union

1.1 Polymers

3D printing polymer materials in liquid state or with low melting point are widely used in 3D printing industry due to their **low cost, low weight and processing flexibility**

FDM Classics Thermoplastic Polymers:

- Polylactic acid (PLA)
- Acrylonitrile butadiene styrene (ABS)
- Polyethylene terephthalate glycol-modified (PETG)
- Acrylonitrile Styrene Acrylate (ASA)
- Thermoplastic Polyurethane (TPU)
- Polypropylene (PP)
- Polyvinyl Alcohol (PVA)

Applications:

- Prototyping
- Aerospace and aerodynamic applications
- Automotive industry
- Artistic objects
- Household items
- Maintenance

1.1 Polymers

PLA (Polylactic acid)

- One of the most popular polymer materials
- Obtained through the starch extracted from corn, beet, or sugar cane

- Simple printing
- Wide variety of colors and patterns
- Biodegradable
- Low melting point
- Lack of toxicity or irritation
- Good biocompatibility

- Brittle
- Weak mechanical properties.

Material Properties

Printing difficulty
Impact resistance
Thermal resistance
Rigidity

Applications:

Prototyping, models, DIY projects, artistic objects, household items, low-wear toys, packaging, and biomedical applications

Co-funded by
the European Union

1.1 Polymers

ABS (Acrylonitrile butadiene styrene)

- Another popular material
- It comes from petroleum

- Good mechanical qualities
- Good impact, chemical, and abrasion resistance
- Withstands higher temperatures
- Easily machined

- Not biodegradable
- Dangerous fumes
- Requires heated bed
- Prone to warping

Material Properties

Printing difficulty
Impact resistance
Thermal resistance
Rigidity

Applications:

Phone covers, high-wear toys, tool handles, automotive trim components, and electrical enclosures

Co-funded by
the European Union

1.1 Polymers

PETG (Polyethylene terephthalate glycol-modified)

- An increasing popular material

- Flexible and strong
- Simple to print
- Very good chemical resistance
- Good resistance against water and UV light
- Biocompatible

- Prone to dampness
- Easily scratched

Material Properties

Printing difficulty
Impact resistance
Thermal resistance
Rigidity

Applications:

Mechanical parts, printer parts, and protective components.

Co-funded by
the European Union

1.1 Polymers

Material Properties

Printing difficulty
Impact resistance
Thermal resistance
Rigidity

ASA (Acrylonitrile Styrene Acrylate)

- An alternative to ABS
- Can withstand environmental conditions

- Good dimensional stability
- Superior UV resistance
- Thermal stability
- Durability
- Allow machined processing

- Difficult to print
- Close chamber recommended

Applications:

Parts exposed to sunshine and for outdoor applications.
Automobile sector.

Co-funded by
the European Union

1.1 Polymers

Material Properties

Printing difficulty
Impact resistance
Thermal resistance
Rigidity

TPU (Thermoplastic Polyurethane)

- Flexible polymers with rubber-like qualities
- They can be stretched to moderate elongations and return to their original shape.

- Extremely flexible and durable
- Flexible properties support low temperatures
- Good abrasion resistance.
- Good resistance to oils and greases.

- Very challenging to print
- High temperature sensitivity

Applications:

Automotive components, home appliances, and medical supplies that require parts that can bend or compress. Manufacturing of shock absorbers.

Co-funded by
the European Union

1.1 Polymers

PP (Polypropylene)

- Very light polymer with a certain flexibility
- Its density is lower than water, can float

- Strong mechanical qualities
- Good resistance to impact and fatigue
- High chemical resistance
- Low friction

- Very difficult to print.
- High deformation in the base
- Difficult to adhere to the base
- Machining leaves surface imperfections

Material Properties

Printing difficulty
Impact resistance
Thermal resistance
Rigidity

Applications:

Functional parts that need to be durable, resistant to chemicals, and wear resistant. Food packaging.

Co-funded by
the European Union

1.1 Polymers

PVA (Polyvinyl Alcohol)

- Water-soluble polymer used as a support material in intricate 3D printing designs

- 100% biodegradable
- Dissolution residues are non-toxic
- It dissolves very quickly in water

- Just for support

Applications:

Support material for the construction of complex geometries with multi-extrusion printers.

1.1 Polymers

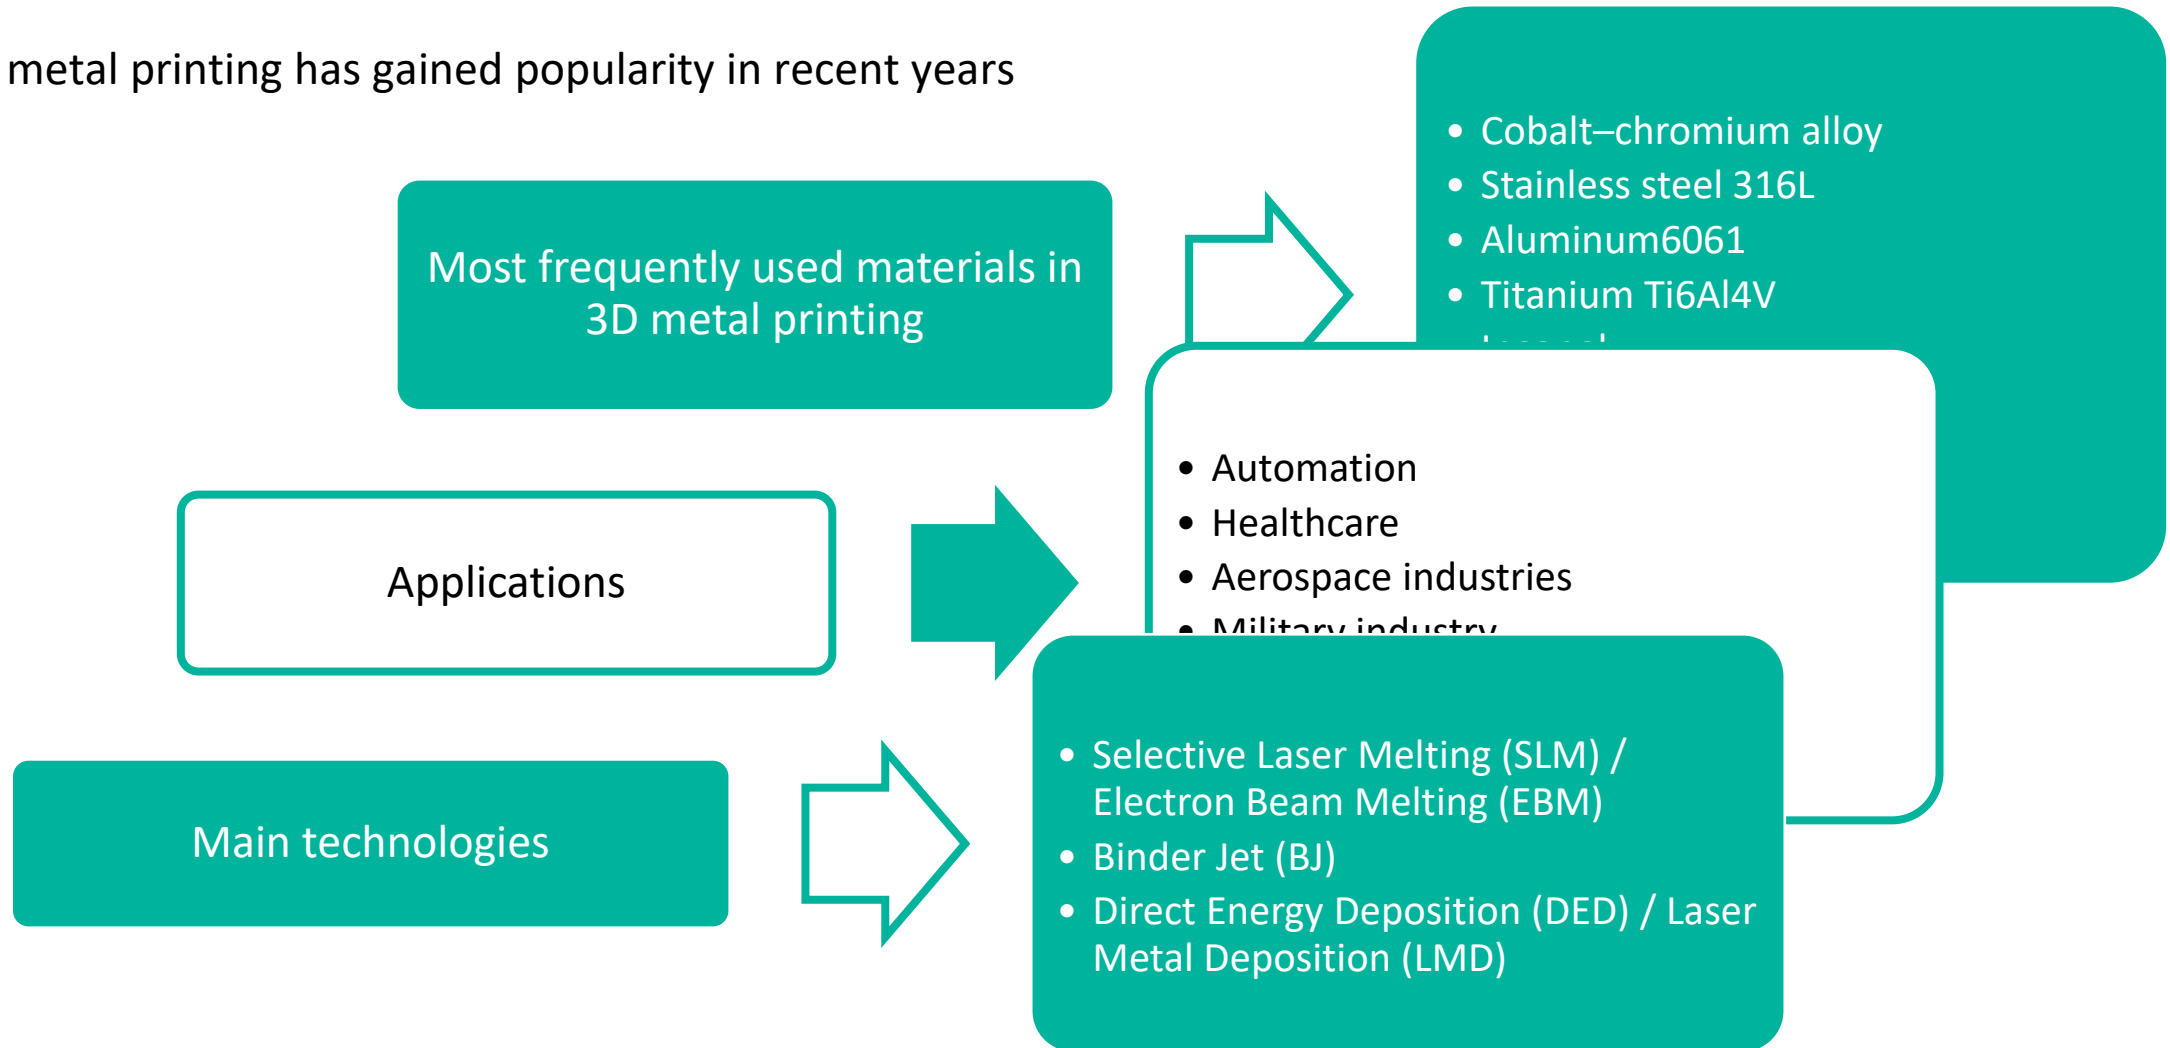

- Stereolithography (SLA)**
- Liquid monomers, called **photopolymer resin**, are tied together to form polymers
 - Resins consist of additives namely stabilizers, flexibilities, monomers/oligomers, solvent, photo-initiators, and reactive diluents etc.

Materials	Properties	Applications/ Industries
DC 100	Lesser shrinkage with higher accuracy.	Used for the casting of patterns for pieces of jewelry.
DC 500	Like wax in nature and can easily burn out.	For the making of precise and thinner wire patterns of jewelry.
DL 350	Highly flexible and resistant to fatigue and chemicals etc	Used to produce parts for industrial as well as general purposes.
DL 360	Strong and transparent in nature.	Produces parts for general purposes which require transparent properties.
AB 001	Provides good strength and stiffness and electrical characteristics	Used for producing parts that are strong and smooth in nature.
GM 08	Highly flexible, strong and elastic.	Produces parts that don't require further finishing operations
DM 210	Great surface qualities and including ceramic-type properties.	Used for jewellery patterns that require liquid silicone that can be extracted quite easily from rubber

1.2 Metals

3D metal printing has gained popularity in recent years

1.2 Metals

Selective Laser Melting (SLM) / Electron Beam Melting (EBM)

Materials	Properties	Applications/ Industries
Titanium	Resistance to corrosion and thermal expansion with great biological compatibility , along with the high strength and lower density .	Its applications are included in but not limited to design, medical, automotive, aerospace, marine industry, and jewelry industries, etc.
Stainless Steel	Increased resistance to wear and tear, corrosion, along with compatible ductility, hardness, and hardenability .	Application in automotive industry, maritime and medical technology, toolmaking and in varied areas of mechanical engineering
Aluminium	Light metal with low density and good electrical conductivity . Easy to process abilities.	Used in aerospace engineering, automotive industry, in the area of prototype construction with complicated geometries.
Cobalt-Chrome	Biologically compatible , with increased hardness , corrosion resistance with comparable strength.	In the medical and dental field, and industries requiring greater thermal resistant properties for example in jet engines
Nickel based alloys	Great weldability and hardenability along with the resistance to corrosion and mechanical strength.	Used in aerospace engineering and fields requiring thermal resistant properties also have applications in tool making.

Titanium

Stainless steel

1.2 Metals

Binder Jet (BJ)

Materials	Properties	Applications/ Industries
Stainless steel	Resistant to heat and corrosion with greater tensile strength.	Used for parts of pump, drilling and mining machinery
Inconel alloy	Supplementing the product with good mechanical properties and even greater density.	Used for the manufacturing of gas turbine blades, for producing steam generators used in pressurized nuclear water reactors, seals and also in pressure vessels, these are widely applicable in the aerospace industry.
Iron	Provides better mechanical properties and is also excellent wear resistant.	Applications are in the production and repairing of automotive components, tooling, and also in machine tools, along with this they are also popular in decorative hardware.

1.2 Metals

Direct Energy Deposition (DED) / Laser Metal Deposition (LMD)

Rocket Nozzle
SS316L
Size:117 x 117 x 180 mm
Weight:3 kg

Materials	Properties	Applications/ Industries
Titanium	Resistance to corrosion and thermal expansion with great biological compatibility, along with high strength and lower density	Used for repairing works in the automation and aerospace industry
Aluminium	Light metal with lower density and better electrical conductivity with alloying properties and easy to process abilities.	Filling of cracks and refitting of manufactured parts
Stainless steel	Resistant to heat and corrosion with greater tensile strength.	Repairing of turbine engines, and other such complex applications
Copper	Malleable, ductile, and better surface finish.	Industrial applications
Inconel	Good mechanical properties and greater density	Aerospace, biomedical applications

1.3 Others Materials

Composites

Composite materials are composed of two or more substances with combined properties that are different from the original components. They typically consist of a matrix and a reinforcement. Composite materials with the **exceptional versatility, low weight, and tailorable properties** have been revolutionizing high-performance industries.

Carbon fibers reinforced polymer composites

- Widely used in aerospace industry.
- High specific stiffness and strength
- Good corrosion resistance and good fatigue performance

Glass fibers reinforced polymer composite:

- Used for various applications
- Cost effectiveness and high-performance
- High thermal conductivity and relatively low coefficient of thermal expansion
- Cannot burn, and it not affected by curing temperatures used in manufacturing processes

1.3 Others Materials

Other FDM materials

Composites materials with a polymeric matrix and fibers of another material, such as wood, ceramic, metal, etc.
Other materials with a low melting point that can be extruded.

Materials	Properties	Applications/ Industries	
Ceramic Slurries and Clay	Alumina, Zirconia, Kaolin	Chemical and physical stability, heat resistance, and compatible thermal conductivity, strength and hardness.	General purpose uses along with the applications in dental field as well
Green Ceramic/Binder Mixture	Zirconia, Calcium phosphate	Resistance to chemicals and corrosion, hardness, wear-resistance, thermal, lower electrical and thermal conductivity and non-magnetic in nature, etc.	Structures suitable for bone substitute scaffolds, and for making piezoelectric components.
Green Metal/Binder Mixture	Stainless steel, Titanium, Inconel, Copper	Providing binder viscosity, flowability, greater sintered density, leads to the homogeneous microstructure of parts. Results in strong, light and corrosion resistant properties	For the manufacturing of mechanical parts used in tooling and fixtures etc.
Food pastes	Sugars and Chocolates	Flowability	Cooking
Biological Materials	Bioink	Easy to print, with desired mechanical properties, can be easily biodegraded, and we can easily install modifiable functional groups on the surface. Post-printing maturation.	Bioprinted organs and scaffolds

1.3 Others Materials

Other FDM materials

FDM ceramic parts

FDM Ultrafuse® 316L (comparable to stainless steel 1.4404) part

FDM Chocolate

FDM Bioink

1.3 Others Materials

Ceramic materials

3D printing technology can produce 3D printed object by using ceramics and concrete without large pores or any cracks.

- Ceramic is **strong, durable and thermal resistant**.
- Ceramics materials is useful in the dental and aerospace application or construction
- Most used ceramics materials are **alumina, bioactive glasses and zirconia**.
- Difficult to print and curing complexity. They need **debinding and sintering**
- Used technologies:
 - **FDM**: Composite filament
 - **SLA**: Ceramic resins
 - **BJ**: Ceramic powder

Topic 2: New trends in 3D printing materials

2.2 Sustainability of Additive Manufacturing

Is Additive Manufacturing Sustainable?

First thought: **Sustainable materials**

- Recycled materials or those made with biodegradable components
- Thermoplastic polymers are easy to recycle

2.2 Sustainability of Additive Manufacturing

Is Additive Manufacturing Sustainable?

Some advantages of AM:

- ✓ Less material consumption
- ✓ Absence of additional tools or fixtures
- ✓ Geometry optimization
- ✓ On-demand manufacturing → reduced storage
- ✓ Localized production → shorter value chains

Good environmental balance

AM technologies fit perfectly into **circular economy** models

- Reduction in material consumption.
- Possibility of using recycled material.
- Its application in maintenance extending the life of products.
- Possibility of optimizing designs.

2.2 Sustainability of Additive Manufacturing

Is Additive Manufacturing Sustainable?

AM technologies have the potential to achieve more sustainable production processes

- ✓ Less waste → **High material efficiency** compared to traditional machining and casting.
- ✓ **No specialized tools** or fixtures required.
- ✓ Ability to build **functionally lightweight parts** while maintaining strength.
- ✓ **Better geometry designs** → optimized geometries with very favorable strength-to-weight ratios.
- ✓ **Reduces the need** for large amounts of **raw material** within the supply chain and transportation.
- ✓ Less impact of the part during its life cycle, resulting in a **lower carbon footprint, less embodied energy**, and a **better economic model**.
- ✓ Ability to **create spare parts on demand** → optimizing or eliminating inventory

2.2 Sustainability of Additive Manufacturing

Sustainable AM: aspects for improvement

Aspects for improving the environmental performance of AM systems:

1. Materials: optimization of the amount of material, recycling possibilities, use of biomaterials or composite materials.
2. Optimization of process parameters: manufacturing strategy, layer height, manufacturing speed...
3. Control of generated emissions: gases and particles.
4. Manufacturing strategy: Use technologies that minimize energy consumption.
5. Use: Promote their use in the reuse and recycling of parts.

Introduction to sustainable manufacturing

From the First to the Fourth Industrial Revolution

With the First Industrial Revolution, thanks to technological development, the industrial sector emerged at the expense of the primary sector.

Subsequently, three new industrial revolutions are identified

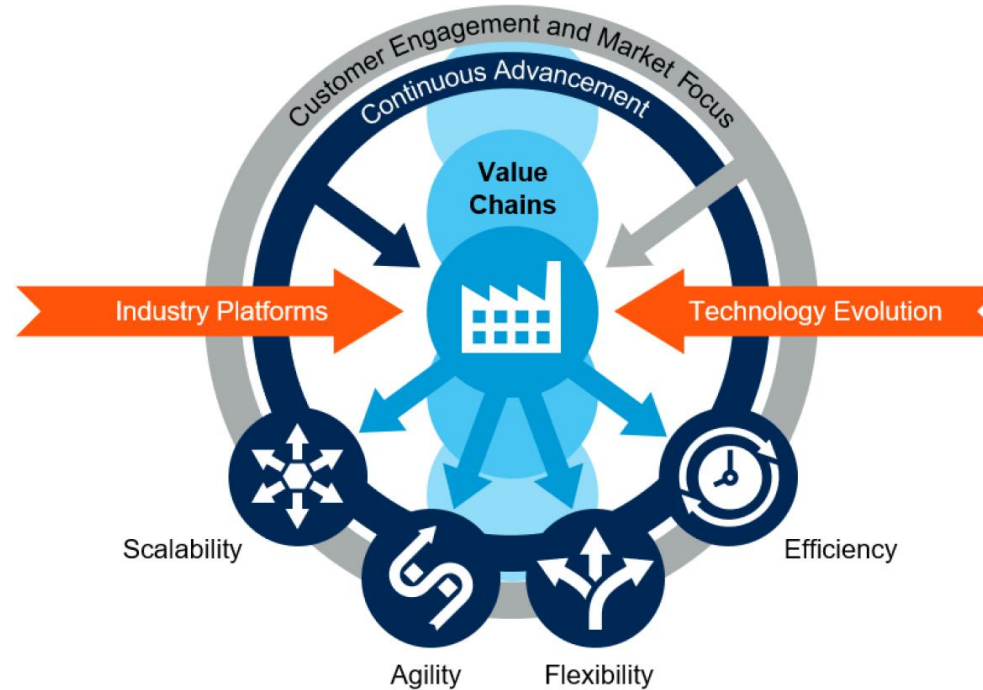

Introduction to sustainable manufacturing

From the First to the Fourth Industrial Revolution

The Fourth Industrial Revolution, also known as Industry 4.0 (Schwab, 2016), is the one that has been developing in recent decades. In this new phase, the industry is moving toward complete digitalization.

Manufacturing Industries Digitalization

Introduction to sustainable manufacturing

From the First to the Fourth Industrial Revolution

Industry 4.0 encompasses a large number of technologies that have developed very rapidly and that complement each other to give rise to a new concept of industry: digital industry. With a **growing importance of data to the detriment of "atoms"**.

Government-led initiatives:

- Factories of the Future (FoF) of the European Commission.
- Catapult of the United Kingdom.
- Industrie du Futur of France.
- Industrie 4.0 in Germany.
- Smart Industry in the Netherlands.
- Impresa 4.0 in Italy.
- Portugal i4.0 in Portugal.

Introduction to sustainable manufacturing

The concept of sustainability

Since the First Industrial Revolution, the world has experienced enormous development without questioning the impact that industrial activities had on the environment.

After World War II, some pioneers began to emerge who warned about environmental problems (Blustein, 2003).

1960s ? **Club of Rome** more firmly questions the impact of industry on the environment. It publishes the "Limits to Growth" report (1972).

1970s ? **Oil crisis** ? The first important sign of a change in the growth model. The crisis produced a wave of deindustrialization in advanced countries, which, with the arrival of globalization, subsequently promoted strong industrialization in eastern countries (Balsa-Barreiro et al., 2019).

1980s ? The concept of sustainable growth emerged. It appears in the 1987 **Brundtland report**:

“development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (WCED, 1987)

Introduction to sustainable manufacturing

The concept of sustainability

1990s ? **Earth Summit** ? The Brundtland Report strategies are developed, including those aimed at:

- More efficient production processes in terms of energy and resource use.
- Preventive strategies.
- Minimizing or eliminating waste.
- Clean production technologies and procedures throughout the product life cycle.

Co-funded by
the European Union

Introduction to sustainable manufacturing

The concept of sustainability

Since the emergence of environmental concerns, there has been a growing social awareness and a transformation of the problems and the way we respond to them.

An interesting example is provided by Zaccai (2012) in his comparison between the 1970s and 1980s and the 2010s.

Table 3
Environmental evolution and representations (70s–80s compared to 2010).

	Environmental evolution and representations	70s–80s	2010
1	<i>Most difficult environmental problems</i>	Pollution	Pollution, fluxes
2	<i>Iconic problems</i>	Wastes, water pollution	Climate change, biodiversity loss
3	<i>Pollution sources addressed by policy</i>	Important point sources (ex. industries)	Important and small point and mobile sources (ex. cars)
4	<i>Actors/activities regarded as main drivers of pollution</i>	Industries, production	Consumers, consumption
5	<i>Region regarded as the main threat for the future of the environment</i>	OECD (USA)	Emerging countries (China)
6	<i>Scale of environmental problems addressed by policy</i>	National, local	Global, national, local actions ("Cinderella")

Introduction to sustainable manufacturing

The concept of sustainability

Wealth (GDP), population, and CO2 emissions are strongly correlated.

Globalization is generating a significant transformation of the global structure in terms of wealth and resource needs, with a clear shift toward the east (Balsa-Barreiro et al., 2019).

Introduction to sustainable manufacturing

Sustainable Development Goals (SDG)

September 15, 2015 ☐ The UN General Assembly adopts the **2030 Agenda** for Sustainable Development, an action plan for people, planet, and prosperity, which also aims to strengthen universal peace and access to justice.

“We are determined to end poverty and hunger everywhere by 2030, to combat inequalities within and between countries, to build peaceful, just, and inclusive societies, to protect human rights and promote gender equality and the empowerment of women and girls, and to ensure lasting protection of the planet and its natural resources.”

the European Union

Introduction to sustainable manufacturing

Sustainable Development Goals (SDG)

Introduction to sustainable manufacturing

Engineering to sustainability: New materials

One of the first design strategies, even prior to the new environmental awareness, was weight reduction, especially in applications oriented toward air, sea, and land transportation.

In particular, the development of new materials accelerated in the second half of the 20th century to respond to these needs (Ashby and Johnson, 2010).

Introduction to sustainable manufacturing

Engineering to sustainability: New materials

One of the first design strategies, even prior to the new environmental awareness, was weight reduction, especially in applications oriented toward air, sea, and land transportation.

In particular, the development of new materials accelerated in the second half of the 20th century to respond to these needs (Ashby and Johnson, 2010).

Introduction to sustainable manufacturing

Engineering to sustainability: New materials

Additionally, R&D&I activities aim to develop sustainable materials.

For example:

- ✓ Biodegradable cutting fluids (Tazehkandi et al., 2015).
- ✓ Wood-based printing materials (Markstedt et al., 2019).
- ✓ Use of agricultural, industrial, municipal, and other waste to generate alternative bricks to traditional clay bricks (Zhang et al., 2018).
- ✓ Use of eco-materials for construction.

Introduction to sustainable manufacturing

Engineering to sustainability: repair/reconstruction

Particularly for high-cost parts, engineering has been developing component repair strategies that extend their useful life.

Maintenance for Sustainability  Industry 4.0

A relevant example is the repair of aircraft engines by leading companies such as Rolls & Royce.

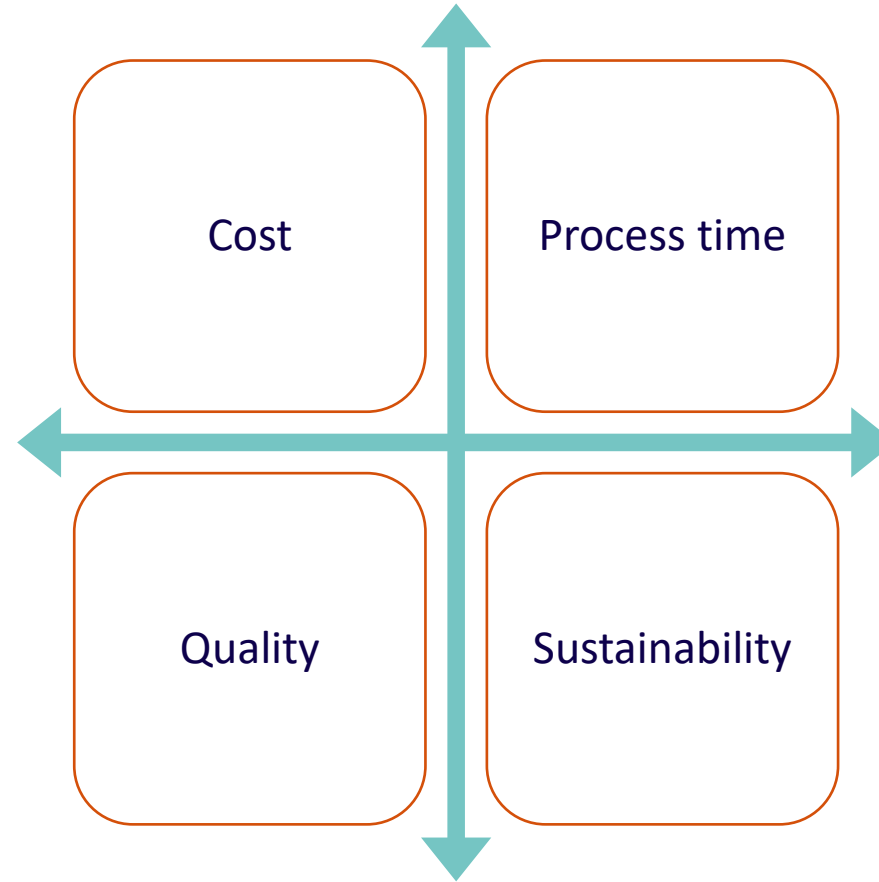

Co-funded by
the European Union

Sustainable design

Integrated Development and Sustainability

Integrated product/process development faces current challenges:

Co-funded by
the European Union

Topic 1: Sustainable design

Sustainable design

Integrated Development and Sustainability

Development-Product Integration  Software + Automation

New CAE engineering support applications integrate various functions: CAD, CAM, numerical simulation, etc.

This allows for evaluating and comparing the influence of design decisions on sustainability (and cost, process time or quality).

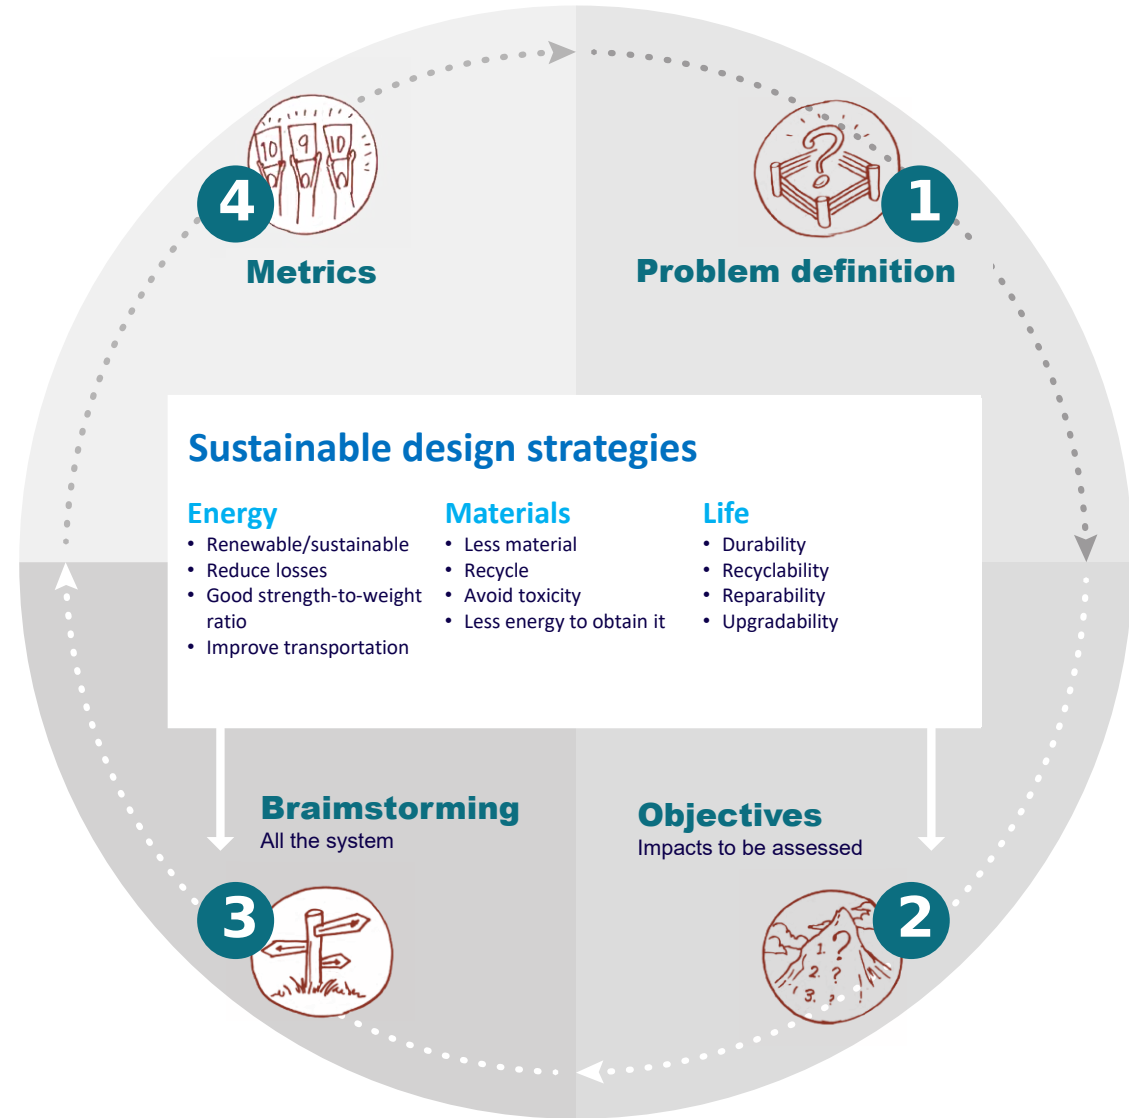

Implementing Product Development-Sustainability Integration:

- ✓ Consider design recommendations
- ✓ Use software to compare environmental impact metrics

Sustainable design

Integrated Development and Sustainability

Product lifespan recommendations: Durability of non-disposable products

Sustainable design

Sustainable product development guides

Energy recommendations: Reduce Losses

- Energy: The capacity to produce work.
- Conversion between energy types is not perfect.
- Sustainable design ☐ Reducing work capacity losses.
- Reducing friction, drag, improving thermal insulation, etc.

Sustainable design

Sustainable product development guides

Energy recommendations: Use renewable energy

Energy with low resource consumption and low environmental impact: wind, solar, hydroelectric, tidal, geothermal and biomass energy

Co-funded by
the European Union

Sustainable design

Sustainable product development guides

Material selection recommendations:

Sustainable design

Principles of sustainable design

Shape:

Shape represents the visual appearance of the product and is typically the main design element. Before launching a product, the designer must answer several questions: How does shape affect energy consumption, packaging, shipping costs, and emissions?

An example is IKEA's flat-pack strategy.

Function and use:

Shape contributes to sustainability indirectly, as it helps consumers use the product more easily and with less energy consumption.

Cost-effective solutions:

Many of today's sustainable products are more expensive than non-sustainable alternatives. Designers are responsible for reducing the cost of these products.

Sustainable design

Principles of sustainable design

Renewable Energy:

Designers should stop relying on carbon energy and think in terms of building products that rely on renewable energy, such as solar panels and wind farms.

Materials and Recycling:

Every designer should look for materials that can be easily recycled or that the planet can recreate in a short period of time.

For example, IKEA relies on mixed woods and innovative materials to replace traditional wood varieties that can take a long time to grow in forests. Mixed and recycled materials can also help reduce product costs.

Durable Design Solutions:

To achieve zero waste, products must be durable enough to last a long time or be fully recycled and transformed into new products. Relying on both methods can help recycle products more than once and reduce dependence on the Earth's resources.

Continuous Improvement and Knowledge Sharing Evaluation and improvement are important parts of any design process, but they become even more important for evaluating sustainable initiatives and improving them enough to achieve the same or better quality than existing products.

Topic 3: Circular economy

Circular economy

Circular economy concept

Today's economy leads us to a consumerist mindset, which has significant impacts through the generation of harmful substances.

Do we know how they are produced, in what quantities, and how to reduce them? Can we do anything to reduce this impact?

The concept of the circular economy began to be used in the 1980s to describe the interaction between the economy and the environment.

Early interpretations were based on waste management based on the three Rs: Reduce, Recycle, and Reuse.

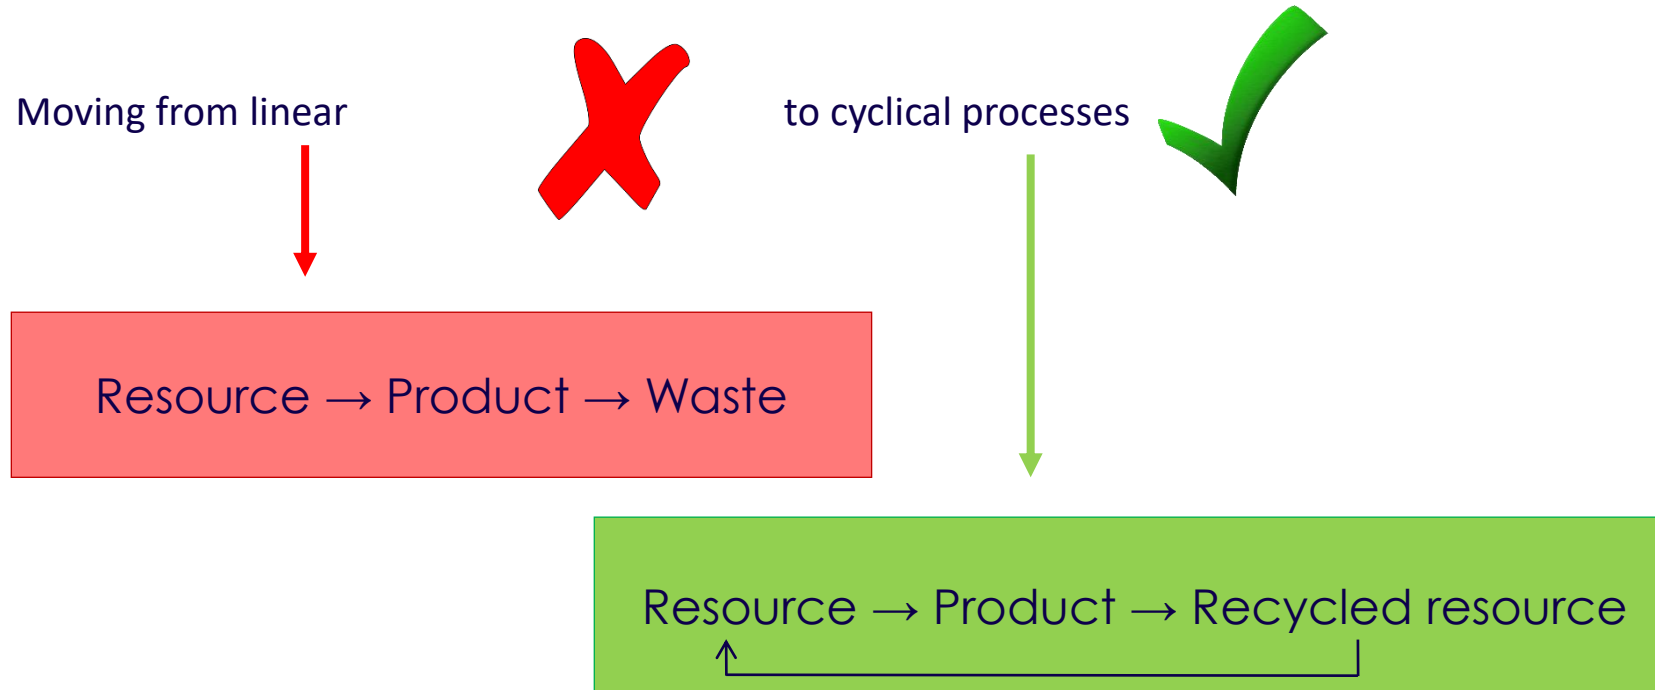

(Although there are more "Rs": rethink, redesign, repair, redistribute, etc.)

Circular economy

Circular economy concept

"Strategy that aims to reduce both the input of virgin materials and the production of waste."

Circular economy

Circular economy concept

“A business model in which the conceptual logic for value creation is based on the utilization of the economic value retained in products after use in the production of new offerings” (Linder & Willander, 2015)

Circular economy

Circular economy concept

<https://youtu.be/zCRKvDyyHml>

Co-funded by
the European Union

Circular economy

Examples of circular economy

Recycling:

Car floor mats and trunk liners are mostly made from recycled PET.

This is the case with the Spanish company Eko-rec, which produces these products, fashion and home accessories, from PET (polyethylene terephthalate) waste, the plastic used to make most water and soft drink bottles.

Each year, it converts 25,000 tons of PET into fibers to make new objects.

Circular economy

Examples of circular economy

Repair and remanufacturing:

The useful life of car batteries can be extended.

Through a technology developed by Rebattery, an SME from Spain, the useful life of batteries can be extended.

Ecodesign:

The environmental impact of waste can be significantly reduced through the application of ecodesign criteria.

A Spanish supermarket group has carried out an ecodesign project with its fabric softener packaging, resulting in a more easily recyclable and lighter package. The weight of the packaging per wash has been reduced by 41.3%. For every 1,000 liters of fabric softener, 15 tons of CO2 are saved.

Topic 4: Sustainability in Additive Manufacturing

Sustainability in Additive Manufacturing

Additive Manufacturing: The Path to Industrial Sustainability

Additive Manufacturing (AM): The process of creating 3D objects from a digital model by depositing material layer by layer (unlike subtractive manufacturing).

AM has transformative potential for sustainability, although its total impact depends on the specific technology, materials, and process management.

No methodology for calculating environmental impact is suitable for AM ? involves a large number of factors to consider, the complexity and diversity of processes, and multiple uses.

Sustainability in Additive Manufacturing

Additive Manufacturing: The Path to Industrial Sustainability

Some advantages of AM:

- ✓ Less material consumption
- ✓ No additional tools or fixtures
- ✓ Geometry optimization
- ✓ On-demand manufacturing ? Reduced storage
- ✓ Localized production ? Shorter value chains

Good environmental balance

AM technologies fit perfectly into circular economy models

- Reduction in material consumption.
- Possibility of using recycled materials.
- Its application in maintenance extends product life.
- Possibility of optimizing designs.

Co-funded by
the European Union

Sustainability in Additive Manufacturing

Key Advantages: Material Usage

Less Waste, Greater Material Efficiency

- Additive Manufacturing (AM): An additive ("to add") process.
 - ✓ Builds the part layer by layer.
 - ✓ Advantage: Minimal material waste (material is used only where needed).
 - ✓ Contrast: Subtractive manufacturing (machining) often produces up to 90% material waste in some cases.
- Sustainable Materials:
 - ✓ Growing use of un-melted metal powders and polymers that can be recycled or reused in subsequent prints (especially in technologies like SLS).
 - ✓ Development of filaments and resins made from recycled plastics and biodegradable materials (e.g., corn-derived PLA).

**ADDITIVE
MANUFACTURING**

Layer-by-Layer

Sustainability in Additive Manufacturing

Key Advantages: Design and Product

Design Optimization and In-Use Savings

- **Optimized Geometries:** AM allows for the creation of complex internal structures (e.g., lattices) resulting in:
 - **Weight Reduction:** Without sacrificing strength.
 - **In-Use Energy Efficiency:** Lighter components in the aerospace and automotive sectors translate to lower fuel or energy consumption over the product's lifespan.
- **Improved Functionality:** Ability to consolidate multiple parts into a single component, simplifying assembly and often improving performance.
- **Rapid Prototyping:** Allows for quick design error correction, significantly reducing material and energy waste during initial development phases

Sustainability in Additive Manufacturing

Key Advantages: Supply Chain

Decentralization and Logistics Reduction

- Local, On-Demand Production:
 - Parts can be printed close to the point of use, reducing the need for long global supply chains.
 - This drastically decreases the carbon footprint associated with transportation and logistics.
- Inventory Reduction:
 - Manufacturing can be done "on-demand" or by order, instead of producing large batches.
 - This eliminates the waste associated with overproduction and the obsolescence of stored parts.
- Reverse Engineering: Ability to scan and reproduce obsolete or spare parts exactly when needed, promoting the circular economy and repair.

Sustainability in Additive Manufacturing

Sustainability Challenges

Outstanding Challenges for a Net Positive Impact

- **Energy Consumption:** Although material waste is low, some AM technologies (e.g., Powder Bed Fusion with lasers) have high energy consumption during the printing process.

Solution: Use of renewable energy sources and machine optimization.

- **Material Recycling:** The recycling of powders and by-products is not universal; the purity of the recycled material and the presence of additives can limit its reuse.

Challenge: Lack of standards and difficulty in post-processing some materials.

- **By-products and Post-Processing:** Post-printing processes (cleaning, curing, sintering) may require additional energy and materials, generating chemical or thermal waste.
- **Toxicity and Exposure:** Some materials and additives, especially chemicals or fine powders, require rigorous safety management and waste disposal.

Sustainability in Additive Manufacturing

Conclusion and Future

Conclusion: AM as a Catalyst for Sustainable Industry

- ✓ **Balance:** Additive Manufacturing offers superior environmental benefits over traditional methods in crucial areas (materials, logistics, and lightweight design).
- ✓ **The Way Forward:** To maximize its sustainability, the industry must focus on:
 1. **Material Innovation:** Developing 100% recyclable and bio-sourced materials.
 2. **Energy Efficiency:** Optimizing machines and processes to reduce consumption per part.
 3. **Standards and Circularity:** Establishing regulations for recycling and actively promoting full integration into Circular Economy models.
- ✓ **Final Message:** AM is not inherently sustainable on its own, but it is a technological tool with enormous potential that must be actively managed and developed toward a more responsible industrial future.
